

KARPAGAM ACADEMY OF HIGHER EDUCATION
 (Deemed University Established Under Section 3 of UGC Act 1956)
 Coimbatore - 641021.
 (For the candidates admitted from 2018 onwards)
DEPARTMENT OF COMMERCE (CA)

SYLLABUS

Semester I

		L	T	P	C
18CCU102	INTRODUCTION TO INFORMATION TECHNOLOGY	5	-	-	5

Course Objective

- ❖ To enable students to understand the significance of computers in business and other areas.
- ❖ To understand the different types of Operating Systems.
- ❖ To impart the essential elements of Computer hardware and software.
- ❖ To provide the students with the opportunity to use common computer and application packages.
- ❖ To give students a broad foundation of basic computing/data processing skills.
- ❖ To provide students to gain knowledge in internet and e-commerce.

Learning Outcome

- The student will be able to apply technical skills and knowledge in business society.
- Students acquire capabilities to develop knowledge in generic software.
- Students are capable to solve common business problems using appropriate Information Technology applications and systems.
- Students come out with identifying applications which are suitable for a database.

UNIT 1

Introduction to Computers: definition, characteristics and limitations of computers - Components of Computer System - Elements of Computers – Hardware - Software – Input and Output – Storage devices. Operating system: Operating Systems – Meaning, Definition, Functions and Types of Operating Systems.

MS Word – Working with Documents – Opening and Saving files, **Document Editing** – Deleting, Cut, Copy, Paste, Undo, Redo, Find, Search and Replace, **Formatting Documents** – Setting Font Styles, Font Selection- style, size, colour etc. Type face – Bold, Italic, Underline, Case settings, Highlighting, Special Symbols, Paragraph style, Alignments, Indents, Line Space, Margins, Bullets & Numbering. Setting Page style – Formatting Page, Page tab, Margins, Layout settings, Paper tray, Border and Shading, Columns, Header & Footer, Setting Footnotes & End Notes – Tables- Table creation – Insertion, deletion, Merging, Splitting, Sorting and Formula, Drawing – Inserting Clip Arts, Pictures/Files etc., Tools – Spell Checks. Grammar Check, Mail Merge, Templates.

UNIT II

MS Excel: Working with Spreadsheets – Opening, Saving files, Setting Margins, Converting files to different formats. **Entering and deleting data** – Entering data, Cut, Copy Paste, Undo, Redo, Highlighting values, Find, Search & Replace, Inserting Data, Insert cells, Columns, Rows & Sheets, Symbols, Clipart. **Formatting Spreadsheets** – Formatting- Alignment, Font, Border & Shading, Hiding/Locking Cells, Inserting Header and Footer, changing Sheet Name, Modifying Row height and Column width, Formatting and Style, Sheet background, Colour etc **Working with sheets** – Sorting, Filtering. **Creating Charts** – Bar Chart, Pie Chart, Line Chart. **Printing**.

UNIT III

Excel Functions: Date and Time Functions – Date, Time, Now, Today, Hour, Minute, Second, Day, Month, Year, Weekday, Mathematics, Statistics, Days. **Mathematical Functions** – Sum, Product, Power, SQRT, Subtotal. **Statistical Functions** – Count, Countif, Count blank, Average, Median, Mode, Standard deviation, Coefficient of Variation, Trend, Maximum, Minimum, Large, Small.

UNIT IV

MS Power point: Introduction to presentation – Opening new presentation, Different presentation templates, Setting backgrounds, Selecting presentation layouts. **Creating a presentation** – Setting Presentation style, Adding text to the Presentation.

Formatting a Presentation – Adding style, Colour, gradient fills, Adding Header & Footer, Slide Background, Slide layout, Adding Graphics to the presentation – Inserting pictures, movies, tables into presentation, Drawing pictures using Draw. **Adding effects to the Presentation** – Setting Animation & transition effect, Printing Handouts, Generating Standalone Presentation viewer.

UNIT V

MS Access: Introduction, Planning a Database, Starting Access, Creating a New Database, Creating Tables, Working with Forms, Creating queries, Finding information in Databases, Creating Reports, Types of Reports. Internet and World Wide Web: Introduction to Internet – Internet access – Internet Addressing – Introduction and use of Email – Working of E-mail – Email names and address – Working in Blogs

LECTURE PLAN DEPARTMENT OF COMMERCE (CA)

STAFF NAME: G. KOWSHALYA

SUB.CODE:18CCU102

SUBJECT NAME: INTRODUCTION TO INFORMATION TECHNOLOGY

SEMESTER: I

CLASS: I B.Com (CA)

S.No	Lecture Duration Period	Topics to be Covered	Support Material/Page Nos
		UNIT-I	
1	1	Introduction to Computers Definition, Characteristics and limitations of computer, Elements of computer system	W3 T1:121-132
2	1	Introduction to Computers Elements of computer system Hardware, software I/O devices, Storage devices	W3 T1:165-173 T1:97-112
3	1	Operating System Meaning, definition, Functions and type of operating systems	W3 T1:179-185
4	1	Working with Documents Opening and Saving files Document Editing	T2:3-4 T2:18-19 T2:22-24
5	1	Formatting Documents	R2:45-49 T2:8 T2:32-36 W1
6	1	Setting Page Style	T2:36-48 T2:82 W2
7	1	Tables Table creation, Insertion, deletion Merging, Splitting, Sorting, Formula	T2:77-80 T2:84-89 W2
8	1	Drawing Inserting Cliparts, Files/Pictures etc	T2:63-74
9	1	Tools Spell checks, Grammar check Mail Merge, Templates	T2:49-53 T2:11-12 W1, W2

10	1	Recapitulation and Discussion of Important Questions	
Total No of Hours Planned For Unit 1=10			
		UNIT-II	
1	1	Working with Spreadsheets Opening, saving files, Setting Margins, Converting Files to different formats	T2:121-123 W4
2	1	Entering and deleting data Entering data, Cut, Copy, Paste Undo, Redo, High lighting Values	T2:151 W4 W5
3	1	Find, search and replace, Inserting Data, Insert cells, Columns, Rows & sheets, Symbols, Clipart	W4 T2:161-163
4	1	Formatting Spreadsheets Formatting, Alignment, Font Border & Shading, Hiding/Locking cells Inserting Header and Footer	T2:157-160 W4 W5
5	1	Formatting Spreadsheets Inserting Header and Footer Changing sheet name, Modifying Row Height and Column width Formatting & style sheet background, Colour etc	T2:141-143 T2:162-163 W4 W5
6	1	Working with sheets Sorting, Filtering Printing	W4 W5
7	1	Creating Charts Bar chart, Pie chart, Line chart	T2:177-185 T2:189-193
8	1	Recapitulation and Discussion of Important Questions	
Total No of Hours Planned For Unit II=8			
		UNIT-III	
1	1	Date and Time functions Date, Time, Now, Today, Hour	T2:169-170 W5
2	1	Date and Time functions Minute, Second, Day, Month, Year, Weekday	W5
3	1	Mathematical functions Sum, Product, Power, SQRT, Subtotal	T2:170-172 W5

4	1	Statistical functions Count, Countif, Countblank, Average	T2:172-175
5	1	Statistical functions Median, Mode, Standard Deviation Coefficient of Variation	T2:172-175 W5
6	1	Statistical functions Trend, Maximum, Minimum Large, Small	W5
7	1	Recapitulation and Discussion of Important Questions	
Total No of Hours Planned For Unit III = 7			
		UNIT-IV	
1	1	Introduction to Presentation Opening new presentation Different presentation templates	T2:209-213
2	1	Introduction to Presentation Setting backgrounds Selecting presentation layouts	T2:215-216 W6
3	1	Creating a presentation Setting presentation style Adding text to the presentation style	W6 T2:213-215
4	1	Formatting a Presentation Adding style, colour, gradient fills Adding Header and Footer, Slide background, Slide layout	T2:219-221 W6 W3
5	1	Formatting a Presentation Adding graphics to the presentation Inserting pictures, movies, tables etc into presentation, Drawing pictures using Draw	T2:216-219 T2:221-224 W6
6	1	Adding effects to the presentation Setting Animation & Transition effect	R2:95-98 T2:226-229
7	1	Printing Handouts Generating Standalone presentation viewer	R2:101-102 T2:230-231 W6
8	1	Recapitulation And Discussion Of Important Questions	
Total No of Hours Planned For Unit IV=8			
		UNIT-V	
1	1	MS Access Introduction, Planning a Database	J1

		Starting Access	R2:141-143
2	1	Creating a New Database, Creating Tables, Working with Forms	T2:237-249
3	1	Creating Queries Finding Information in the Database	T2:248-251
4	1	Creating Reports, Types of Reports	W4, W3
5	1	Internet and World Wide Web Introduction to Internet, Internet Address, Internet Access	W3 R2:267-268 T1:27
6	1	Introduction and use of Email Working of Email	T1:257-260 W3
7	1	Email Names and Address Working in Blogs	W3 R2:309-315
8	1	Recapitulation and Discussion of important Questions	
9	1	Discussion of Previous ESE Question Papers.	
10	1	Discussion of Previous ESE Question Papers.	
11	1	Discussion of Previous ESE Question Papers.	
	Total No of Hours Planned for unit V=11		
Total Planned Hours	44

UNIT-I

SYLLABUS

Introduction to Computers: definition, characteristics and limitations of computers - Components of Computer System - Elements of Computers – Hardware - Software – Input and Output – Storage devices. Operating system: Operating Systems – Meaning, Definition, Functions and Types of Operating Systems

MS Word – Working with Documents – Opening and Saving files, Document Editing – Deleting, Cut, Copy, Paste, Undo, Redo, Find, Search and Replace, Formatting Documents – Setting Font Styles, Font Selection- style, size, colour etc. Type face – Bold, Italic, Underline, Case settings, Highlighting, Special Symbols, Paragraph style, Alignments, Indents, Line Space, Margins, Bullets & Numbering. Setting Page style – Formatting Page, Page tab, Margins, Layout settings, Paper tray, Border and Shading, Columns, Header & Footer, Setting Footnotes & End Notes – Tables- Table creation – Insertion, deletion, Merging, Splitting, Sorting and Formula, Drawing – Inserting Clip Arts, Pictures/Files etc., Tools – Spell Checks. Grammar Check, Mail Merge, Templates.

INTRODUCTION:

The term computer is derived from the Latin word compute, which means to calculate. A computer is an electronic machine, devised for performing calculations and controlling operations that can be expressed either in logical or numerical terms. In simple terms, a computer is an electronic device that performs diverse operations with the help of instructions to process the information in order to achieve the desired results. Computer application extends to cover huge area including education, industries, government, medicine, scientific research etc. A computer is one of the most influential forces available in modern times. Due to its memory, high speed and perfection, its application can be extended to almost infinite levels.

Millions of complex calculations can be done in mere fraction of time. Difficult decisions can be made with accuracy for comparatively little cost. Computers are widely seen as instruments for future progress and as tools to achieve substantiality by way of improved access to information by means of video conferencing and e-mail. Indeed computers have left such an impression on modern civilization that we call this era as the information age.

Definition:

A computer is an electronic data processing device, which accepts and stores data input, processes the data input, and generates the output in a required format.

If we look at it in a very broad sense, any digital computer carries out the following five

Functions:

Step 1 - Takes data as input.

Step 2 - Stores the data/instructions in its memory and uses them as required.

Step 3 - Processes the data and converts it into useful information.

Step 4 - Generates the output.

- Controls all the above four steps.

CHARACTERISTICS OF COMPUTERS:

The main characteristics of computers are:

- a) Speed
- b) Storage
- c) Accuracy
- d) Versatility
- e) Automation
- f) Diligence
- g) Reliability

A. **Speed** : Computers are capable of carrying out the task with enormous speed. Today's computers, according to their class, can perform from 4 MIPS (Millions of instructions per second) to 100 MIPS. What may take days for manual calculations may take only a few hours

for computers to perform. Inside the computer the information signal travels at incredible electronic speed.

B. **Storage:** Computers can store enormous quantity of information. Which is expressed in terms of Kilobytes (or) Mega Bytes (MB) or Giga Bytes (GB). It is achieved through its 'Main memory' or 'Primary storage' and through 'auxiliary storage' or 'Secondary storage'. The Hard disks Floppy disk, Compact Disc(CD) and Magnetic Tape storage are examples of secondary storages. These large volumes of storage occupy much lesser space compared to paper documents and this aspect of computers makes them more powerful.

c) **Accuracy:** The accuracy of a Computer is consistently high. In fact, this quality of the computers make them indispensable in various fields such as Scientific Research, Space, Weather Predictions and many other areas where precision of a high order is required. The accuracy of the computer is best achieved by programming them in the most efficient manner. When it comes to very complex mathematical or scientific problem the computer's accuracy has no substitute.

d) **Versatility:** Computers are versatile in that they can perform almost any task, provided they are given the appropriate logical steps. For example, they are capable of performing wide ranging tasks such as construction of a payroll, inventory management in a factory, hotel billing, hospital management, banking applications and any imaginable task in every walk of life.

e) **Automation:** The biggest advantage of computers is that it is automatic in its operation. Once a programming logic is initiated the computer performs repeated operations without human interventions until program completion.

f) **Diligence:** Computers are machines and that do not get tired or 'lose concentration' like human beings. If a large number of calculations say million calculations are to be performed the resultant output will remain exactly the same even if operations are repeated any number of times. But when a human being is asked to do the same job this consistency cannot be achieved. Thus for those who want consistent and continuous standard output, computer's 'diligence' is of great help.

g) **Reliability:** The computers give very accurate results with predetermined values. They correct and modify the parameters automatically, giving suitable signals. They give formatted results with high degree of precisions.

LIMITATIONS OF COMPUTERS:

1) No I.Q.

- ☐ A computer is a machine that has no intelligence to perform any task.
- ☐ Each instruction has to be given to the computer.
- ☐ A computer cannot take any decision on its own.

2) Dependency

- ☐ It functions as per the user's instruction, thus it is fully dependent on humans.

3) Environment

- ☐ The operating environment of the computer should be dust free and suitable.

4) No Feeling

- ☐ Computers have no feelings or emotions.
- ☐ It cannot make judgment based on feeling, taste, experience, and knowledge unlike humans

COMPONENTS OF COMPUTER SYSTEM

A computer system is a combination of various components. It performs the system functions such as input, processing, output, storage and control. A computer system consists of the following components:

1. Hardware
2. Software

3. Human ware

4. Firmware

5. Bridge ware

1. Hardware : The physical components of the computer, such as electrical, electronics and mechanical unit are known as the hardware of the computer. That is, the input units, output units and CPU are called hardware. Thus hardware is the equipment involved in the function of a computer. It consists of the components that can be physically handled. The function of these components is typically divided into three main categories: input, output, and storage. Components in these categories connect to microprocessors, output and storage. Components in these categories connect to microprocessors, specifically, the computer's central processing unit (CPU), the electronic circuitry that provides the computational ability and control of the computer, via wires or circuitry called a bus.

2. Software: The computer performs operations like addition, subtraction, multiplication and division only when the user instructs it to do so. The user issues instructions and the CPU acts in accordance with the instructions. The sets of instructions, which control the sequence of operations, are known as programs, and collectively programs are called software. The software can be broadly classified into two types. They are:

a. System Software

b. Application software

3. Human ware: The man-machine interface is called a human ware. The people who work with the computer are collectively called the human ware or livewire.

4. Firmware: The computer programs permanently stored in ROM or PROM are called firmware. These programs are provided by hardware manufacturer along with the computers. Generally these are booting programs which help in the starting of a computer. Such programs cannot be erased or overwritten.

5. Bridge ware: The computer components and programs used to translate

instructions and information written for one type of computer into a format that another type of computer can understand is called bridge ware. This is necessary because different computers are made by different manufacturers.

ELEMENTS OF COMPUTER:

A computer system consists of **hardware**, the physical unit (parts) of the computer that are capable of computing and manipulating information and software (set of instructions or programs) that carries out predefined tasks to complete a given job. The computer performs operations like addition, subtraction, multiplication and division only when the user instructs it to do so. The user issues instructions and the CPU acts in accordance with the instructions. The sets of instructions, which control the sequence of operations, are known as programs, and collectively programs are called **software**.

We can equate hardware and software with human body and human intelligence, respectively. All human physical actions such as walking and eating are based on the thoughts and feelings, which is raised by the brain. If the brain does not raise thoughts and feelings, we do not perform any physical activity. Similarly, the actions and functioning of every hardware equipment is driven by software. The combination of physical equipment (hardware) and logical instructions (software) gives modern computing system their power and versatility.

COMPONENTS OF HARDWARE:

- I. Input unit: This unit accepts instructions and data.
- II. Output unit: This unit communicates the results to the user.
- III. Storage unit: This unit stores temporary and final results.
- IV. Central Processing Unit (CPU): This unit performs processing of instructions and data inside the computer.

The CPU has three components:

- a) The Control Unit
- b) The Arithmetic Logic Unit (ALU) and c) The Memory Unit.

a)Control Unit: It controls the overall operation of the computer system. It is considered as the heart of the computer system. It controls all the other units, directs them to operate in a proper

way and co-ordinates various operations performed. It instructs the input device to transfer the data and instructions to the main memory and then to the arithmetic and logic unit (ALU). Then, it sends the processed result from ALU to the memory unit for storage and transfers it to the visual display unit or to the ' printer. The control unit coordinates the various parts of the computer system - the arithmetic logic unit, the memory unit and the peripheral units.

Besides, it controls the flow of data into, from and within the main storage as per the program instructions. To perform its control operations effectively and quickly, the control unit has four basic components. They are

(a)Instruction Register

(b)Decoder

(c)Address Register

and (d) Instruction Counter.

The instruction register receives one by one the instructions to be executed in the required sequence. Then, the operation code of the instructions is transferred to decoder, which decodes the operation code. And it activates the appropriate circuits of the arithmetic and logic unit to perform the operation. The address register enables the data in the location specified in the instruction to be transferred to a specified accumulator for the arithmetic and logic unit.

b) Arithmetic Logic Unit (ALU) This unit performs two kinds of operations, the arithmetic processing and logical processing. In arithmetic processing it performs all mathematical operations such as addition, subtraction, multiplication and division. In logical processing, it performs the relational and logical operations such as comparing larger or smaller values, true or false statements, etc.

c)Memory Unit : This unit holds the intermediate results during the course of calculations and provides the data as and when required. This internal storage is also called primary memory or main memory. This memory takes the data from an input device and stores it until the computer is ready to process it. It also stores processed data and intermediate results. When the processing is finished, it transfers the results to an output device.

SOFTWARE

Software is a generic term for organized collection of computer data and instructions. It is responsible for controlling, integrating, and managing the hardware components of a computer and to accomplish specific tasks. In other words, software tells the computer what to do and how to do it. For example, software instructs the hardware what to display on the user's screen, what kinds of input to take from the user, and what kinds of output to generate. Thus, software communicates with the hardware by organizing the control sequences, and the hardware carries out the instructions defined by the software.

A computer needs to be instructed to perform any task. These instructions are given in the form of computer programs, which are written in computer programming languages. A program controls the activity of the processor. The moment the hardware (processor, memory, etc.), acts as per the instructions of a program, the program is said to be in running or executing state. A set of programs, which are specifically written to provide the user a precise functionality like solving a specific problem is termed as a software package. For example, word processing software package provides functionality to the computer so that it can be used to create text documents like letters and mailing lists. Similarly, an image processing software package assists a user in drawing and manipulating graphics.

FEATURES OF SOFTWARE

1. Ease of use : The software systems and applications are becoming more and more easy to use. In fact, software developers and system analysts go to great lengths to ensure that the products they develop are user-friendlier than their competitor's products.

2. Graphical user interface (GUI) : GUI or graphical user interface has now become the default standard for most of the software applications. Gone are the days of the crude character based interfaces of UNIX and DOS application. Today's software applications and products provide the users with perceptive, graphical and easy-to-use interfaces. Now the users do not have to remember the cryptic system commands or shortcut keys that were a must in the character based era. Now almost any task can be accomplished by a mouse click.

3. Multi-platform capability : Today's software applications are not developed for just one platform. Most of the software applications supports multiple platforms-both hardware and

software platforms. There are software applications that support hardware platforms ranging from mainframes to PCs and different software platforms like MVS, Solaris, AIX, UNIX, Windows and so on. For example IBM's DB2 Universal database is available for a variety of hardware and software platforms.

Another important feature of today's software application is that they support multiple languages and multiple currencies. Many vendors are providing their applications in many languages like English, Arabic, Japanese, and Chinese and so on.

4. Compatibility with other software : Now the competition for each market segment in the software marketplace is rather fierce. We have many software vendors battling for the market share in the same segment. For example, Microsoft Word 2000 supports all previous versions of Word like Word 97, Word 6, Word and so on. The two features –compatibility with earlier versions and compatibility with other products make it easier for the users, as they can choose the application they want and still use the old files they have created using other applications or using older versions of the same application.

5. Mail enabling Mail enabled applications are designed to take advantage of on e-mail. These are the familiar word processors, spreadsheets, and other individual desktop applications that have email features built to them. There is another class of message-centered programs that are built specifically around e-mail functions.

6. Web enabling With the ever-increasing popularity of internet and the amount of information that is available on the net, most software applications are now web-enabled. Web enabling helps the user in many different ways. Its use starts while the user is installing the application. During installation, most of the applications will automatically connect to the Internet and to the vendor's web site and will register their products (earlier one had to fill in a paper form and mail or fax it to the vendor).

INPUT DEVICES:

Following are some of the important input devices which are used in a computer:

- ☐ Keyboard
- ☐ Mouse

- ☐ Joy Stick
- ☐ Light pen
- ☐ Track Ball
- ☐ Scanner
- ☐ Graphic Tablet
- ☐ Microphone
- ☐ Magnetic Ink Card Reader (MICR)
- ☐ Optical Character Reader (OCR)
- ☐ Bar Code Reader
- ☐ Optical Mark Reader (OMR)

Keyboard

Keyboard is the most common and very popular input device which helps to input data to the computer. The layout of the keyboard is like that of traditional typewriter, although there are some additional keys provided for performing additional functions.

Keyboards are of two sizes 84 keys or 101/102 keys, but now keyboards with 104 keys or 108 keys are also available for Windows and Internet.

Mouse

Mouse is the most popular pointing device. It is a very famous cursor-control device having a small palm size box with a round ball at its base, which senses the movement of the mouse and sends corresponding signals to the CPU when the mouse buttons are pressed. Generally, it has two buttons called the left and the right button and a wheel is present between the buttons. A mouse can be used to control the position of the cursor on the screen, but it cannot be used to enter text into the computer.

Advantages

- ☐ Easy to use
- ☐ Not very expensive
- ☐ Moves the cursor faster than the arrow keys of the keyboard

Joystick

Joystick is also a pointing device, which is used to move the cursor position on a monitor screen. It is a stick having a spherical ball at its both lower and upper ends. The lower spherical ball moves in a socket. The joystick can be moved in all four directions.

The function of the joystick is similar to that of a mouse. It is mainly used in Computer Aided Designing (CAD) and playing computer games.

Light Pen

Light pen is a pointing device similar to a pen. It is used to select a displayed menu item or draw pictures on the monitor screen. It consists of a photocell and an optical system placed in a small tube. When the tip of a light pen is moved over the monitor screen and the pen button is pressed, its photocell sensing element detects the screen location and sends the corresponding signal to the CPU.

Track Ball

Track ball is an input device that is mostly used in notebook or laptop computer, instead of a mouse. This is a ball which is half inserted and by moving fingers on the ball, the pointer can be moved. Since the whole device is not moved, a track ball requires less space than a mouse. A track ball comes in various shapes like a ball, a button, or a square.

Scanner

Scanner is an input device, which works more like a photocopy machine. It is used when some information is available on paper and it is to be transferred to the hard disk of the computer for further manipulation. Scanner captures images from the source which are then converted into a digital form that can be stored on the disk. These images can be edited before they are printed.

Magnetic Ink Card Reader (MICR)

MICR input device is generally used in banks as there are large number of cheques to be processed every day. The bank's code number and cheque number are printed on the cheques with a special type of ink that contains particles of magnetic material that are machine readable. This reading process is called Magnetic Ink Character Recognition (MICR). The main advantages of MICR is that it is fast and less error prone.

Optical Character Reader (OCR)

OCR is an input device used to read a printed text. OCR scans the text optically, character by character, converts them into a machine readable code, and stores the text on the system memory.

Optical Mark Reader (OMR)

OMR is a special type of optical scanner used to recognize the type of mark made by pen or pencil. It is used where one out of a few alternatives is to be selected and marked. It is specially used for checking the answer sheets of examinations having multiple choice questions.

OUTPUT DEVICES:

Following are some of the important output devices used in a computer.

- ☐ Monitors
- ☐ Graphic Plotter
- ☐ Printer

Monitors

Monitors, commonly called as **Visual Display Unit (VDU)**, are the main output device of a computer. It forms images from tiny dots, called pixels that are arranged in a rectangular form. The

sharpness of the image depends upon the number of pixels. There are two kinds of viewing screen used for monitors.

- ☐ Cathode-Ray Tube (CRT)
- ☐ Flat-Panel Display

Cathode-Ray Tube (CRT) Monitor:

The CRT display is made up of small picture elements called pixels. The smaller the pixels, the better the image clarity or resolution. It takes more than one illuminated pixel to form a whole character, such as the letter 'e' in the word help.

A finite number of characters can be displayed on a screen at once. The screen can be divided into a series of character boxes - fixed location on the screen where a standard character can be placed. Most screens are capable of displaying 80 characters of data horizontally and 25 lines vertically.

There are some disadvantages of CRT:

- ☐ Large in Size
- ☐ High power consumption

Flat-Panel Display Monitor:

The flat-panel display refers to a class of video devices that have reduced volume, weight and power requirement in comparison to the CRT. You can hang them on walls or wear them on your wrists. Current uses of flat-panel displays include calculators, video games, monitors, laptop computer, and graphics display.

The flat-panel display is divided into two categories:

- ☐ **Emissive Displays** - Emissive displays are devices that convert electrical energy into light. For example, plasma panel and LED (Light-Emitting Diodes).

- ☐ **Non-Emissive Displays** - Non-emissive displays use optical effects to convert sunlight or light from some other source into graphics patterns. For example, LCD (Liquid-Crystal Device).

Printers

Printer is an output device, which is used to print information on paper. There are two types of printers:

- ☐ Impact Printers
- ☐ Non-Impact Printers

Impact Printers

Impact printers print the characters by striking them on the ribbon, which is then pressed on the paper.

Characteristics of Impact Printers are the following:

- ☐ Very low consumable costs
- ☐ Very noisy
- ☐ Useful for bulk printing due to low cost
- ☐ There is physical contact with the paper to produce an image These printers are of two types
- ☐ Character printers
- ☐ Line printers

Non-impact Printers:

Non-impact printers print the characters without using the ribbon. These printers print a complete page at a time, thus they are also called as Page Printers. These printers are of two types -

- ☐ Laser Printers

- ☐ Inkjet Printers

Benefits of Non-impact Printers

- ☐ Faster than impact printers
- ☐ They are not noisy
- ☐ High quality
- ☐ Supports many fonts and different character size

STORAGE DEVICES:

There are two types of storage devices.

- a. Primary storage device
- b. Secondary Storage device.

a. PRIMARY STORAGE DEVICE OR RANDOM ACCESS MEMORY [RAM]: Primary storage is usually referred to as Random Access Memory [RAM] because it is possible to randomly select and use any location of this memory to directly store and retrieve data and instructions. It is also referred to as read/write memory because information can be 'read' from a RAM chip also be 'written' into it. The Random Access Memory requires some times for accessing data and is considered to be the fastest memory. Each bit in a RAM stores infomr ation by means of electric charge, where the presence of an electric charge indicates '1' and the absence of an '0'. RAM is called Temporary storage, because data persists until the machine is on.

ROM : A Read Only Memory [ROM] is one in which information is permanently stored. The information from the memory can only be read and it is not possible to write fresh information into it. This is the reason why it is called ROM. When the power supply is switched off, the information stored inside ROM is not lost as it is in the case of a RAM chip. ROMs are mainly used by computer manufacturers for storing the micro programs so that they cannot be modified by the users.

b. SECONDARY STORAGE DEVICES :

This section of the memory is also referred to as backup storage because it is used to store large volume of data on a permanent basis which can be partially transferred to the primary storage as and when required for processing. The storage capacity of the primary storage of today's computers is not sufficient to store the large volume of time handled by most data processing centres. As a result, additional memory, called auxiliary memory or secondary storage, is used with most computer systems. Hard Disk, Floppy Disk, Tape and Compact Disc are the main secondary storage devices.

i) Hard Disk: The hard disk used in the PC is permanently fixed, hard disks with storage capacities of 8 GB, 10GB, 20GB, 40GB, are quite common, the CPU can use the hard disk to load programs and data as well as to store data. We should operate the PC within a dust-free and cool room (Preferably air-conditioned) to prevent hard disk crash.

ii). Floppy Disk: Floppy disk is flexible circular disk of diameter 3.inches made of plastic coated with a magnetic material. This is housed in a square plastic jacket. The floppy disk can store 1.4 Mbytes of data [also called 1.44Mbytes, since it holds 1440Kbytes]. Data recorded on a floppy disk is read and stored in a computer's memory by a device called a floppy disk drive[FDD]. A floppy disk is inserted in a slot of the FDD. Some of the floppies have limited life time. The floppies have to be recycled periodically to keep them alive. A frequently recycled floppy. [i.e used] will have a life time of 3to 4 years to do recycling take out old floppies occasionally and try to read them once, at least the directory.

iii). Compact Disk: CD-ROM [Compact Read Only Memory] uses a laser beam to record and read data along spiral tracks on a 5 1/4" disk. A disk can store around 650/00MB of information. CD-ROMs are normally used to store data as back up. Using a CD Writer, lot of information can be written on CD-ROM and stored for future reference.

iv). Tape Drives: Even though tape drives are one of the oldest of storage technologies, they can still hold the most data on a single cartridge. A computer tape drive works similar to a tape recorder or a VCR. A plastic tape ribbon is coated with magnetic particles which are polarized by a magnetic field generated by the read/write head. Since tape is a sequential, and not a random-access media, a tape drive has to wind through a tape to locate a specific bit of data. This makes accessing data slow so tape is mainly used for system backups and regular archiving of files and records. Tape drives allow users to backup large amounts of data. Tape drives are capable of backing up a couple hundred megabytes to several gigabytes of information without having to spend large sums of money on disks.

OPERATING SYSTEM:

Meaning:

An **operating system (OS)** is [system software](#) that manages [computer hardware](#) and [software](#) resources and provides common [services](#) for [computer program](#)

Definition:

An operating system (OS) is system software that manages computer hardware and software resources and provides common services for computer programs.

FUNCTIONS OF OPERATING SYSTEM:

Following are some of important functions of an operating System.

Memory Management

Process Management

Device Management

File Management

Security

Memory Management:

Memory management refers to management of Primary Memory or Main Memory. Main memory is a large array of words or bytes where each word or byte has its own address.

Main memory provides a fast storage that can be accessed directly by the CPU. For a program to be executed, it must in the main memory. An Operating System does the following activities for memory management –

Keeps tracks of primary memory, i.e., what part of it are in use by whom, what part is not in use.

Allocates the memory when a process requests it to do so.

De-allocates the memory when a process no longer needs it or has been terminated.

Process Management:

In multiprogramming environment, the OS processor when and for how much time. **scheduling**. An Operating System does the management – decides which process gets the This function is called **process** following activities for processor keeps tracks of processor and status of process. The program responsible for this task is known as **traffic controller**.

Allocates the processor (CPU) to a process. De-allocates processor when a process is no longer required.

Device Management:

An Operating System manages device communication via their respective drivers. It does the following activities for device management –

Keeps tracks of all devices. Program responsible for this task is known as the **I/O controller**.

Decides which process gets the device when and for how much time.

Allocates the device in the efficient way.

De-allocates devices.

File Management:

A file system is normally organized into directories for easy navigation and usage.

These directories may contain files and other directions.

An Operating System does the following activities for file management –

Keeps track of information, location, uses, status etc. The collective facilities are often known as **file system**.

Decides who gets the resources.

Allocates the resources.

De-allocates the resources.

Security Management:

By means of password and similar other techniques, it prevents unauthorized access to programs and data.

TYPES OF OPERATING SYSTEM:

There are Many Operating Systems those have be Developed for Performing the Operations those are requested by the user. There are Many Operating Systems which have the Capability to Perform the requests those are received from the System. The Operating system can perform a Single Operation and also Multiple Operations at a Time. So there are many types of Operating systems those are organized by using their Working Techniques.

a) DESKTOP OPERATING SYSTEM

The control program in a user's machine (desktop or laptop). Also called a "client operating system," Windows is the overwhelming majority while the Macintosh comes second. There are also several versions of Linux for the desktop.

b) SERVER OPERATING SYSTEM:

A server operating system, also called a server OS, is an operating system specifically designed to run on servers, which are specialized computers that operate within a client/server architecture to serve the requests of client computers on the network. The server operating system, or server OS, is the software layer on top of which other software programs, or applications, can run on the server hardware. Server operating systems help enable and facilitate typical server roles such as Web server, mail server, file server, database server, application server and print server.

c) MAINFRAME OPERATING SYSTEM:

Mainframe operating systems are sophisticated products with substantially different characteristics and purposes. The architecture is distinct from the physical design, and, in fact, different machine designs might conform to the same

computer architecture. In a sense, the architecture is the computer as seen by the user, such as a system programmer. For example, part of the architecture is the set of machine instructions that the computer can recognize and execute. In the mainframe environment, the system software and hardware comprise a highly advanced computer architecture, the result of decades of technological innovation. **MULTIUSER OPERATING SYSTEM:** A multi-user operating system extends the basic concept of multi-tasking with facilities that identify processes and resources, such as disk space, belonging to multiple users, and the system permits multiple users to interact with the system at the same time.

C. MULTIPROCESSING OPERATING SYSTEM: The Multi-processing Operating Systems never use any cards because the Process is entered on the Spot by the user. But the Operating System also uses the Process of Allocation and De-allocation of the Memory Means he will

provide the Memory Space to all the Running and all the Waiting Processes. There must be the Proper Management of all the Running Jobs.

d) MULTITASKING OPERATING SYSTEM:A multi-tasking operating system allows more than one program to be running in concurrency. This is achieved by time-sharing, dividing the available processor time between multiple processes that are each interrupted repeatedly in time slices by a task-scheduling subsystem of the operating system. Multi-tasking may be characterized in preemptive and co-operative types.

e) MULTITHREADING OPERATING SYSTEM:It allows different parts of a single program to run concurrently.Multithreaing is an ability of an operating system to execute different parts of a program called threads.

MS –Word

Working with Documents:

Opening and Saving a Document:

To open an existing document, you click the Microsoft Office Button and then click Open to display the Open dialog box. The first time you use this command, the dialog box displays the contents of your Documents folder. If you display the dialog box again in the same Word session, it displays the contents of whatever folder you last used. To see the contents of a different folder, you use standard Windows techniques. After you locate the file you want to work with, you can double-click it to open it.

Each document you create is temporary unless you save it as a file with a unique name or location. To save a document for the first time, you click the Save button on the Quick Access Toolbar or click the Microsoft Office Button and then click Save. Either action displays the Save As dialog box, where you can assign the name and storage location.

If you want to save the document in a folder other than the one shown in the Address bar, you can click the chevrons to the left of the current folder name and then navigate to the folder you want. You can also click Browse Folders to display the Navigation Pane and a toolbar. If you want to create a new folder in which to store the file, you can click the New Folder button on this toolbar.

After you save a document the first time, you can save changes simply by clicking the Save button. The new version of the document then overwrites the previous version. If you want to keep both the new version and the previous version, click Save As on the Office menu, and then save the new version with a different name in the same location or with the same name in a different location.

Document Editing.

Deleting:

Use the **BACKSPACE** and **DELETE** keys on the keyboard to delete text. Backspace will delete text to the left of the cursor and Delete will erase text to the right. To delete a large selection of text, highlight it using any of the methods outlined above and press the **DELETE** key.

You can easily delete the text in Word including characters, paragraphs or all of the content of your document. Word offers you different methods to delete the text; some of the commonly used methods are given below;

- Place the cursor next to the text then press Backspace key
- Place the cursor to the left of the text then press Delete key
- Select the text and press the Backspace or Delete key
- Select the text and type over it the new text.

Cut, Copy and Paste:

Text can be inserted in a document at any point using any of the following methods:

- ☐ **Type Text:** Put your cursor where you want to add the text and begin typing
- ☐ **Copy,** Highlight the text you wish to copy and right click and
- ☐ put your cursor where you want the text in the document and right click and click
- ☐ **Paste.** Ctrl + V (hold down the CTRL and the “V” key at the same time) or use the Clipboard group to Paste, Paste Special, or Paste as Hyperlink
- ☐ **Cut and Paste Text:** Highlight the text you wish to copy and right click and click **Cut**, put your cursor where you want the text in the document and right click and click **Paste**.

Undo and Redo

Redo is a function performed on a computer that does any **undo** function again. For example, if you deleted text and perform an **undo**, then decide that you wanted that text deleted again, you could do a **redo**.

shortcut key to **redo** is usually Ctrl+Y

shortcut key to **undo** is usually Ctrl+Z

Find, Search and Replace:

Word's *Find and Replace* function will search your documents for specific text, which can then be highlighted, replaced with different text or formatting, or left as-is.

Finding Text

Word allows you to find specific text in a variety of ways. You may choose to view each occurrence of the text individually, see all occurrences selected at once, or highlight all occurrences even after the *Find and Replace* dialog box is closed.

Accessing the Find and Replace Dialog Box

To find text, you must first access the *Find and Replace* dialog box.

Windows: From the *Home* command tab, in the *Editing* group, click **FIND** or Press [Ctrl] +

[F]

Word allows you to choose how to replace text in your document. You may choose to replace all occurrences of a particular word or phrase or look at each occurrence before deciding which to replace.

Accessing the Find and Replace Dialog Box

Windows: From the *Home* command tab, in the *Editing* group, click **REPLACE** or

Windows: Press [Ctrl] + [H]

The *Find and Replace* dialog box appears, with the *Replace* tab displayed.

Selecting:

This option will highlight all occurrences of your text until you choose to clear the highlighting.

NOTE: This option is for Windows only.

To highlight all occurrences:

Access the Find and Replace dialog box

- In the *Find what* text box, type the text you want to search for
- To set advanced options

I. Click **MORE >>**

Select the desired options

II. Click **READING HIGHLIGHT** » select **Highlight All**

III. To close the *Find and Replace* dialog box, click **CLOSE** or Click **CANCEL**

To clear all highlighted text:

Access the Find and Replace dialog box

Click **READING HIGHLIGHT** » select **Clear Highlighting**

To close the *Find and Replace* dialog box, click **CLOSE** or Click **CANCEL**

Document Formatting:

Font Styles

A style is a format enhancing tool that includes font typefaces, font size, effects (bold, italics, underline, etc.), colors and more. You will notice that on the Home Tab of the Ribbon, that you have several areas that will control the style of your document: Font, Paragraph, and Styles.

Font size:

- ☐ Click the **arrow** next to the font size and choose the appropriate size, or
- ☐ Click the **increase** or **decrease** font size buttons.

Font Styles:

The basic steps to change the font of a text in a document are given below;

- Select the text you want to modify
- Select the Home tab and locate the Font group
- Click the drop-down arrow next to font style box
- Font style menu appears
- With a left click select the desired font style
- If you want to change the font to bold or italic, click the 'B' or 'I' icons on the format bar.

Font styles are predefined formatting options that are used to emphasize text. They include: Bold, Italic, and Underline. To add these to text:

- ☐ Select the text and click the **Font Styles** included on the Font Group on the **Home Tab** of the Ribbon, or
- ☐ Select the text and right click to display the font tools

Font Color

MS Word allows you to change the Font color of your text. If you want to emphasize a particular word or phrase, you can change its font color. The basic steps to change the Font color are given below;

- Select the text you want to modify
- In Home tab locate the Font group
- Click the drop-down arrow next to Font color button
- Font color menu appears
- Select the desired font color with a left click
- Word will change the Font color of the selected text.

See the image:

To change the text color:

- ☐ Select the text and click the **Colors** button included on the Font Group on the **Home Tab** of the Ribbon, or highlight the text and right click and choose the colors tool.
- ☐ Select the color by clicking the down arrow next to the font color button.

TypeFace:

To set the font typeface:

- ☐ Click the **arrow** next to the font name and choose a font.
- ☐ Remember that you can preview how the new font will look by highlighting the text, and hovering over the new font typeface.

Bold, Italic and Underline:

These commands are given in the Font group in the Home tab. Their functions are given below;

- **Bold:** It allows you to Bold the text of your document
- **Italic:** It allows you to Italicize the text of your document
- **Underline:** It allows you to underline the text of your document

See the image:

Case Settings:

You can easily change the text case in your document by following the steps given below;

- Select the text you want to change
- In Home tab locate the Font group
- Click the drop-down arrow in 'Change Case' button
- It displays text case menu
- Select the desired case with a left click

The case menu offers four options;

Sentence case: It capitalizes the first letter of each sentence.

Lowercase: It changes the text from uppercase to lowercase.

Uppercase: It capitalizes all the all letters of your text.

Capitalize Each Word: It capitalizes the first letter of each word.

Toggle Case: It allows you to shift between two case views, e.g. to shift between Capitalize Each Word and cAPITALIZE eACH wORD .

See the image:

Highlighting:

Highlighting text allows you to use emphasize text as you would if you had a marker. To highlight text:

- ☐ Select the text
- ☐ Click the **Highlight Button** on the Font Group on the **Home Tab** of the Ribbon, or

- ☐ Select the text and right click and select the highlight tool
- ☐ To change the color of the highlighter click on down arrow next to the highlight button, Then choose the suitable one.

Special Symbols:

Step 1 – To insert a special symbol, bring your cursor at the place where you want to insert the symbol. Click the **Insert** tab. You will find two options under the symbol button (a) **Equation** and (b) **Symbols**. Click either of these two options based on your requirement. You will further use equations while preparing mathematical or scientific or any similar document. For now, we are going to understand the use of the **Symbol** button as shown below.

Step 2 – When you click the **Symbol** button, a small list of symbols will appear as shown below.

Step 3 – Now click on any of the available symbols in the box to insert that in your document at the selected location. If you do not find the desired symbol in this small box, then you can click at the **More Symbols** option to have a wide range of symbols as shown below in the symbol dialog box. You can select any of the symbol and then click the **Insert** button to insert the selected symbol.

Symbol Dialog Box

Paragraph Style

You can create professional and presentable documents in MS Word by applying different styles. The basic steps to apply a style in a document are listed below;

- Select the text to which you want to apply the style
- Select the Home tab
- In Styles group you will see different styles;

- To view more styles click the drop-down arrow
- It displays style menu
- Select the desired style with a left-click

See the image:

Alignment

Left-Aligned Text

A paragraph's text is left aligned when it is aligned evenly along the left margin. Here is a simple procedure to make a paragraph text left-aligned.

Step 1 – Click anywhere on the paragraph you want to align and click the **Align Text Left** button available on the **Home** tab or simply press the **Ctrl + L** keys.

Center Aligned Text

A paragraph's text will be said center aligned if it is in the center of the left and right margins. Here is a simple procedure to make a paragraph text center aligned.

Step 1 – Click anywhere on the paragraph you want to align and click the **Center** button available on the **Home tab** or simply press the **Ctrl + E** keys.

Right-Aligned Text

A paragraph's text is right-aligned when it is aligned evenly along the right margin. Here is a simple procedure to make a paragraph text right-aligned.

Step 1 – Click anywhere on the paragraph you want to align and click the **Align Text Right** button available on the **Home tab** or simply press the **Ctrl + R** keys.

Justified Text

A paragraph's text is justified when it is aligned evenly along both the left and the right margins. Following is a simple procedure to make a paragraph text justified.

Step 1 – Click anywhere on the paragraph you want to align and click the **Justify** button available on the **Home tab** or simply press the **Ctrl + J** keys.

When you click the **Justify** button, it displays four options, justify, justify low, justify high and justify medium. You need to select only the justify option. The difference between these options is that low justify creates little space between two words, medium creates a more space than low justify and high creates maximum space between two words to justify the text.

Indent:

Left Indentation

Left indentation means to move the left edge of the paragraph inward towards the center of the paragraph. Let us use the following steps to create left indentation.

Step 1 – Click anywhere on the paragraph you want to indent left and click the **Increase Indent** button available on the **Home tab** or simply press the **Ctrl + M** keys. You can click multiple times to create deeper indentation.

Step 2 – You can remove left indentation by clicking the **Decrease Indent** button available on **Home tab** or simply press **Ctrl + Shift+ M** keys. You can click multiple times to remove deeper indentation.

You can also use the **Paragraph Dialog** Box to set left and right indentations. We will see this dialog box in the last section of this chapter.

Right Indentation

Right indentation means to move the right edge of the paragraph inward towards the center of the paragraph. Let us use the following steps to create right indentation.

Step 1 – Click anywhere on the paragraph you want to indent and then click on the Increase Right Indent spinner available on the Page Layout tab. You can click on the spinner multiple times to create deeper indentation. You can use the Left Indent spinners as well to set left indentation from the same place.

Step 2 – You can remove right indentation by clicking the **Decrease Right Indent** spinner in the opposite direction.

You can also use the **Paragraph Dialog Box** to set the left and the right indentations. We will see this dialog box in the next section.

First Line Indentation

You can move the left side of the first line of a paragraph inward toward the center. Let us see the procedure to perform first line indentation.

Step 1 – Click anywhere on the paragraph you want to indent right and click the **Paragraph Dialog Box** launcher available on the **Home tab**.

Step 2 – Click the **Before Text** spinner to set left indentation and select the **First Line Option** to move the left side of the first line of a paragraph inward toward the center. You can control the movement by setting the **Indentation Unit**. A preview box will give only the idea and not the indentation status.

Line spacing:

Following are the simple steps to adjust spacing between two lines of the document.

Step 1 – Select the paragraph or paragraphs for which you want to define spacing. You can use any of the text selection method to select the paragraph(s).

Step 2 – Click the **Line and Paragraph Spacing Button** triangle to display a list of options to adjust space between the lines. You can select any of the option available by simply clicking over it.

Spacing between Paragraphs

You can also set distance between two paragraphs. Following are the simple steps to set this distance.

Step 1 – Select the paragraph or paragraphs for which you want to define spacing and click the **Paragraph Dialog Box** launcher available on the **Home tab**.

Step 2 – Click the **Before** spinner to increase or decrease the space before the selected paragraph. Similar way, click the **After** spinner to increase or decrease the space after the selected paragraph. Finally, click the **OK** button to apply the changes.

Margins:

Margins are the space between the edge of the paper and the text. You can adjust the right, left, top, and bottom margins of your document. By default, Word sets all margins left, right, top, and bottom to 1 inch.

In the screenshot given below, I have shown top, left and right margins, if you will type the complete page, word will leave 1-inch bottom margin as well.

Adjust Margins

The following steps will help you understand how to set margins for an open document.

Step 1 – Open the document the margins of which need to be set. If you want the margins to be applied only to a selected part of a document, select that particular part.

Step 2 – Click the **Page Layout** tab, and click the **Margins** button in the Page Setup group. This will display a list of options to be selected but you have to click the **Custom Margins** option available at the bottom.

You can also select any of the predefined margins from the list, but using custom margins option you will have more control on all the settings.

Step 3 – You will have to display a **Page Dialog Box** as shown below where you can set top, left, right and bottom margins under the **Margins** Tab. Select the **Apply to:** option to apply the margin on selected text or complete document.

Step 4 – If you are going to bind the document and want to add an extra amount of space on one edge for the binding, enter that amount in the **Gutter** text box, and select the side the gutter is on with the **Gutter Position** drop-down list. After setting all the desired values for all the margins, click the **OK** button to apply the margins.

Bullets and Numbering:

Microsoft word provides bullets and numbers to put a list of items in a nice order. This chapter will teach you simple steps to create either the bulleted or the numbered lists in simple steps.

Create a List from Existing Text

This is very simple to convert a list of lines into a bulleted or numbered list. Following are the simple steps to create either bulleted list or numbered list.

Step 1 – Select a list of text to which you want to assign bullets or numbers. You can use any of the text selection method to select the portion of text.

Step 2 – Click the **Bullet Button** triangle to display a list of bullets you want to assign to the list. You can select any of the bullet style available by simply clicking over it.

Step 3 – If you are willing to create a list with numbers, then click the **Numbering Button** triangle instead of the bullet button to display a list of numbers you want to assign to the list. You can select any of the numbering style available by simply clicking over it.

Setting Page Style:

Page tab

Tabs are a paragraph-formatting feature used to align text. When you press the Tab key, Word inserts a tab character and moves the insertion point to the tab setting, called the *tab stop*. You can set custom tabs or use Word's default tab settings.

Tabs are set to distribute text evenly between the left and right margins. Word's default tabs are set every half-inch. These tabs are indicated at the bottom of the horizontal ruler by tiny tick marks.

If you don't want to use the default tabs that are set at half-inch tabs, you have two choices. Change the distance between the default/existing tabs or create custom tabs.

The four most common types of custom tabs are left-aligned, centered, right-aligned, and decimal-aligned. Custom tab settings are indicated on the horizontal ruler by tab markers.

There are two ways to set tabs. By either using the Tabs Dialog Box or using the ruler.

Setting tabs by using the ruler is an easy, two-step process. Click the Tab Alignment button on the left of the ruler to choose the type of alignment and then click the position on the ruler to set the tab.

Adjusting Tab Settings

You can adjust tabs inserted in a document by using either the Tabs dialog box or the ruler (by clicking and dragging).

Margin

The margin is the space between the text and border of a document. By default, it is a one-inch space. Depending on your needs, it can be changed by following the below-listed steps;

- Select the Page Layout tab
- In Page Setup group click the Margins command
- A list of Margins appears
- Select the desired Margin with a left click

See the image:

To customize Margins select 'Custom Margins'. It displays a 'Page Setup' dialog box. Enter the desired margin size and click Ok.

See the image:

Layout settings

Page Orientation refers to the direction in which a document is displayed. It is of two types; portrait (vertical) and landscape (horizontal). The default orientation is portrait; it can be changed to landscape by following these steps;

- Select the Page Layout tab
- Locate the Page Setup group
- In Page Setup group click the Orientation command
- It displays two options, Portrait and Landscape
- Select the desired page orientation

See this images:

Paper tray:

Once you have installed and setup a multi-tray printer you might like to try to print a document to different printer trays. Open a word document and create a two page document.

- Click the page layout tab
- Click the triangle at the bottom right
- Open the page setup dialog box and click the page Paper Tab
- Choose a tray for the first page and other pages. Close the dialog box and print.

This is shown in the image below:

Page Setup to select trays

Once you have this all setup and working you can install Tray Selector and automate the process to store particular print drops under a button and access them in a single click.

In order to achieve this result time and time again without requiring you to change settings in page-setup you should install Tray Selector and try out our free 30 day trial. You should soon see the benefits of a modern multi-function printer.

Trouble Shooting

Some printer and printer drivers appear to be setup to ignore Microsoft Words instructions and always print to the same printer tray. It is often solved by setting the tray selection setting in the printer driver to “auto select”.

Borders and shading:

Add Borders to Text

Following are the simple steps to add border to any text or paragraph.

Step 1 – Select the portion of text or paragraph to which you want to add border. You can use any of the text selection method to select the paragraph(s).

Step 2 – Click the **Border Button** to display a list of options to put a border around the selected text or paragraph. You can select any of the option available by simply clicking over it.

Step 3 – Try to add different borders like left, right top or bottom by selecting different options from the border options.

Step 4 – To delete the existing border, simply select the **No Border** option from the border options.

Note – You can add a horizontal line by selecting the **Horizontal Line** option from the border options. Otherwise type --- (three hyphens) and press **ENTER**. A single, light horizontal line will be created between the left and the right margins.

Add Borders to Page

You can add borders of your choice to word pages by following the steps given below.

Step 1 – Click the **Border Button** to display a list of options to put a border. Select the **Border and Shading** option available at the bottom of the list of options as shown in the above screenshot. This will display a **Border and Shading** dialog box. This dialog box can be used to set borders and shading around a selected text or page borders.

Step 2 – Click the **Page Border** tab which will display a list of border settings, styles and options whether this border should be applied to the whole document or just one page or the first page.

Step 3 – You can use the **Preview** section to disable or enable left, right, top or bottom borders of the page. Follow the instruction given in the preview section itself.

Step 4 – You can customize your border by setting its color, width by using different art available under the style section.

You can have similar or even better borders as given below.

Add Shades to Text

The following steps will help you understand how to add shades on a selected portion of text or a paragraph(s).

Step 1 – Click the **Border Button** to display a list of options to put a border. Select the **Border and Shading** option available at the bottom of the list of options as shown in the above screenshot. This will display a **Border and Shading** dialog box. This dialog box can be used to set borders and shading around a selected portion of text or page borders.

Step 2 – Click the **Shading** tab; this tab will display the options to select **fill**, **color** and **style** and whether this border should be applied to a paragraph or a portion of text.

Step 3 – You can use the **Preview** section to have an idea about the expected result. Once you are done, click the **OK** button to apply the result.

Columns

Sometimes the information you include in your document is best displayed in **columns**. Not only can columns help improve readability, but some types of documents—like newspaper articles, newsletters, and flyers—are often written in column format. Word also allows you to adjust your columns by adding **column breaks**.

To add columns to a document:

1. Select the text you want to format.

2. Select the **Page Layout** tab, then click the **Columns** command. A drop-down menu will appear.
3. Select the number of columns you want to create.

4. The text will format into columns.

Header and Footer

Header and Footer allow you to add additional information like dates, file names, page numbers at the top or bottom of your document. The basic steps to set up a header and footer are given below;

- Select the Insert tab
- Locate the Header & Footer group
- It shows Header and Footer commands
- As required click either Header or Footer command
- It displays a list of built in Header or Footer options
- Select the desired option

See the image:

If you select the Blank option it displays Design tab with header and footer tools.

See the image:

Once the Design tab is active you can add Date and Time to Header or Footer by clicking the Date & Time command. On clicking it displays 'Date & Time' dialog box. Select the desired date format, time format or date & time format.

Setting Footnotes and End notes

Footnotes appear at the bottom of the page and endnotes come at the end of the document. A number or symbol on the footnote or endnote matches up with a reference mark in the document.

1. Click where you want to reference to the footnote or endnote.
2. On the **References** tab, select **Insert Footnote** or **Insert Endnote**.

3. Enter what you want in the footnote or endnote.

- Return to your place in the document by double-clicking the number or symbol at the beginning of the note.

Tables:

Table creation and Insertion

The following steps will help you understand how to create a table in a Word document.

Step 1 – Click the **Insert tab** followed by the **Table** button. This will display a simple grid as shown below. When you move your mouse over the grid cells, it makes a table in the table that appears in the document. You can make your table having the desired number of rows and columns.

Step 2 – Click the square representing the lower-right corner of your table, which will create an actual table in your document and Word goes in the table design mode. The table design mode has many options to work with as shown below.

Step 3 – This is an optional step that can be worked out if you want to have a fancy table. Click the **Table Styles** button to display a gallery of table styles. When you move your mouse over any of the styles, it shows real time preview of your actual table.

Step 4 – To select any of the styles, just click the built-in table style and you will see that the selected style has been applied on your table.

Deletion:

Delete a Table

Following are the simple steps to delete an existing table from a word document.

Step 1 – Click anywhere in the table you want to delete.

Step 2 – Click the **Layout** tab, and click the **Delete Table** option under the **Delete Table Button** to delete the complete table from the document along with its content.

Merging

The following steps will help you merge table cells in a Word document.

Step 1 – Bring your mouse pointer position inside the first cell that you want to merge. Now press the **Shift** key and click the cells around the cell which you want to merge into the first cell. This will highlight the cells which you click and they will be ready to be merged.

Step 2 – Now click the **Layout tab** and then click the **Merge Cells** button which will merge all the selected cells.

After merging the cells, all the content of the cells will be scrambled which you can fix later as you like. For example, you can convert the merged cells text into title or some other description.

Splitting

Following are the simple steps to split a table into two tables in a Word document.

Step 1 – Bring your mouse pointer position anywhere in the row that should appear as the first row of the new table.

Step 2 – Now click the **Layout tab** and then click the **Split Table** button which will split the table into two tables and the selected row will become the first row of the lower table.

KARPAGAM ACADEMY OF HIGHER EDUCATION

CLASS: I B.Com(CA)

COURSE NAME: Introduction to Information Technology

COURSE CODE: 18CCU102

UNIT: I(Intoduction to computers, Operating systems, MS Word)

BATCH -2018-2021

After splitting the table into two tables, you can further divide it into two parts and you can continue dividing the Word tables as long as a table has more than one row.

Sorting

Word's sorting tool, often used for alphabetizing bibliographies or other text-based lists, can also sort numerical information in lists or in tables. You can even choose which column Word will use to sort the table; the standard method uses the first column to sort in ascending order, but you can select a different column if desired. Word will automatically compare the numerical values in that column and rearrange the rows, organizing the cells in the selected column by ascending order.

Sorting in ascending order starts with the smallest number and moves upward.

Step1

Open the document and click anywhere in the table that you want to sort.

Step2

Click the "Home" tab on the Ribbon.

Step3

Click the "Sort" icon, in the Paragraph group on the Ribbon. The icon displays a capital "A," a capital "Z" and a downward arrow. Clicking this icon activates the Sort dialog box.

Formula

Add a Formula

Following are the simple steps to add formula in a table cell available in Word document.

Step 1 – Consider the following table with the total number of rows. Click in a cell that should contain the sum of the rows.

Step 2 – Now click the **Layout tab** and then click the **Formula button**; this will display a **Formula Dialog Box** which will suggest a default formula, which is **=SUM(LEFT)** in our case. You can select a number format using **Number Format List Box** to display the result or you can change the formula using the **Formula List Box**.

Step 3 – Now click **OK** to apply the formula and you will see that the left cells have been added and the sum has been put in the total cell where we wanted to have it. You can repeat the procedure to have the sum of other two rows as well.

Cell Formulae

The Formula dialog box provides the following important functions to be used as formula in a cell.

S.No	Formula & Description
1	AVERAGE() The average of a list of cells
2	COUNT() The number of items in a list of cells
3	MAX() The largest value in a list of cells
4	MIN() The smallest value in a list of cells
5	PRODUCT() The multiplication of a list of cells
6	SUM() The sum of a list of cells

Drawing**Inserting Clip Arts, Pictures/Files etc**

Clip art refers to a graphic or a picture that you can insert in your document. It comes in different formats and styles. It is used to enhance the appearance of a document. The steps to insert a clip art are given below;

- Place the cursor where you want to insert the clip art
- Select the Insert tab
- In Illustrations group click the Clip Art command;

- A task pane appears on the right side of document
- Enter the keyword in 'Search for' field and select the suitable option in 'Search in' and 'Results should be' fields
- Click Go, clip art menu will appear
- Select the desired clip art with a left click

See the image:

Pictures make our text more attractive and readable. You can insert relevant pictures in your text by following these steps;

- Place the cursor where you want to insert the picture
- Select the Insert tab on Ribbon
- In Illustrations group click the Picture command;

- It displays 'Insert Picture' dialog box
- Select the desired image
- Click Insert to insert the picture

See the image:

Smart Art

You can insert Smart Art Graphics in your document to effectively communicate your message. You can insert a process flow, a relationship or an organization hierarchy. The steps to insert smart art graphics are given below;

- Place the cursor in the document where you want to insert graphics

- Select the Insert tab
- In Illustrations group select the 'Smart Art' command;

- On left side, a dialog box appears with list of categories
- In the center you will see the illustrations available in a category
- Select the desired illustration and click Ok

See the image:

Word Art is designed to allow you make your text more attractive; you can format your text to make it look like a picture and enhance its appearance in different ways. The steps to insert WordArt are given below;

- Place the cursor where you want to insert WordArt
- Select the Insert tab
- In Text group click the 'WordArt' button
- WordArt menu appears;

- Select the desired WordArt style
- 'Edit WordArt Text' dialog box appears
- Type the text in text area and click OK

See the image:

Tools:**Spell Check & Grammar Check**

All Microsoft Office programs can check the spelling and grammar. You can check spelling and grammar all at once by running the spelling and grammar checker, or you can check spelling and grammar automatically and make corrections as you work. You can also turn the automatic spelling and grammar off if you'd like.

To start a check of the spelling and grammar in your file just press F7 or follow these steps:

1. Open most Office programs, click the **Review** tab on the ribbon. In Access or InfoPath you can skip this step.
2. Click **Spelling** or **Spelling & Grammar**.

3. If the program finds spelling mistakes, a dialog box appears with the first misspelled word found by the spelling checker.
4. After you decide how to resolve the misspelling (ignoring it, adding it to the program's dictionary, or changing it), the program moves to the next misspelled word.

Mail Merge

When you are performing a **Mail Merge**, you will need a **Word document** (you can start with an existing one or create a new one) and a **recipient list**, which is typically an **Excel workbook**. If you'd like to work along with the lesson, you can download the examples below.

- Letter (Word document)
- Recipient list (Excel workbook)

To use Mail Merge:

1. Open an **existing** Word document, or create a **new** one.
2. Click the **Mailings** tab.
3. Click the **Start Mail Merge** command.
4. Select **Step by Step Mail Merge Wizard**.

The Mail Merge task pane appears and will guide you through the **six main steps** to complete a merge. The following is an example of how to create a form letter and merge the letter with a **recipient list**.

Step 1:

1. Choose the type of document you want to create. In this example, select **Letters**.

2. Click **Next: Starting document** to move to Step 2.

Step 2:

1. Select **Use the current document**.

2. Click **Next: Select recipients** to move to Step 3.

Step 3:

Now you'll need an address list so Word can automatically place each address into the document. The list can be in an existing file, such as an **Excel workbook**, or you can **type a new address list** from within the Mail Merge Wizard.

1. From the **Mail Merge** task pane, select **Use an existing list**, then click **Browse**.

2. Locate your file in the dialog box (you may have to navigate to a different folder), then click **Open**.

KARPAGAM ACADEMY OF HIGHER EDUCATION

CLASS: I B.Com(CA)

COURSE NAME: Introduction to Information Technology

COURSE CODE: 18CCU102

UNIT: I(Intoduction to computers, Operating systems, MS Word)

BATCH -2018-2021

3. If the address list is in an Excel workbook, select the **worksheet** that contains the list, then click **OK**.

4. In the **Mail Merge Recipients** dialog box, you can **check** or **uncheck** each recipient to control which ones are used in the merge. When you're done, click **OK** to close the dialog box.

5. From the **Mail Merge** task pane, click **Next: Write your letter** to move to Step 4.

If you don't have an existing address list, you can click the **Type a new list** button and click **Create**. You can then type your address list.

Step 4:

Now you're ready to write your letter. When it's printed, each copy of the letter will basically be the same, except the **recipient data**—like the **name** and **address**—will be different on each one. You'll need to add **placeholders** for the recipient data so Mail Merge knows exactly where to add the data. If you're using Mail Merge with an existing letter, make sure the file is open.

To insert recipient data:

1. Place the insertion point in the document where you want the information to appear.
2. Select **Address block**, **Greeting line**, **Electronic postage**, or **More items** from the task pane.

3. Depending on your selection, a dialog box may appear with various options. Select the desired options, then click **OK**.

Insert Address Block

Specify address elements

☒ Insert recipient's name in this format:

Mr. Josh Randall Jr.
Mr. Josh Q. Randall Jr.
Mr. Joshua Randall Jr.
Mr. Joshua Q. Randall Jr.
The Randall Family
Josh and Cynthia

☒ Insert company name

☒ Insert postal address:

☐ Never include the country/region in the address
☐ Always include the country/region in the address
☒ Only include the country/region if different than:
United States

☒ Format address according to the destination country/region

Preview

Here is a preview from your recipient list:

Ms. Kathy Albertson
1024 Lakeview Cir
Peachtree City, GA

Correct Problems

If items in your address block are missing or out of order, use Match Fields to identify the correct address elements from your mailing list.

Match Fields...

OK Cancel

4. A placeholder appears in your document (for example: «**AddressBlock**»).
5. Repeat these steps each time you need to enter information from your data record.
6. From the **Mail Merge** task pane, click **Next: Preview your letters** to move to Step 5.

For some letters, you'll only need to add an **Address block** and **Greeting line**. Sometimes, however, you may want to place **recipient data** within the body of the letter to further **personalize it**.

Step 5:

1. Preview the letters to make sure information from the recipient list appears correctly in the letter. You can use the left and right scroll arrows to view each document.

2. Click **Next: Complete the merge** to move to Step 6.

Step 6:

1. Click **Print** to print the letters.

Template

To create a template in Word 2010,

1. Open a blank Word document and adjust your styles (see page 5), margins (see page 8), and any automatic numbering features you want in your document.
2. In the File Ribbon, select **Save as...**, then select **Word Template**. Save it somewhere that you can find easily.
3. To modify your template later, open Word first, then open the template file – if you double-click on it, it will create a new document based on the template as described below.

To create a template in Word 2013,

1. Adjust your styles, margins, etc. in a BLANK document.
2. In the File Ribbon, select **Save As**, then click on the **Browse** button. A dialogue box will come up. The **Save as Type** dropdown defaults to .docx. In order to save the file as a template, you can use either the .dotx or .dotm format. Unless you are using macros in your document, choose the **.dotx** option.

To create a document from your template or apply it to an existing document,

1. Double-click on the template file you created in the steps above. This will open a new document based on that template.
2. If you already have a chapter written, you can insert that chapter into this new document to apply any style settings to it. To do this...
 - On the Insert Ribbon, in the **Text Group**, click on the arrow next to the Object icon and select *Text from File...*
 - Navigate to the document you wish to insert and click *Insert*.

Possible Questions – UNIT I

PART –A (1MARK)

(Online Examinations)

PART- B (2 MARK)

1. Define Computer.
2. What are the Components of Computer?
3. What is ALU?
4. Mention some input devices.
5. What are the different types of case settings?
6. Write about the different types of Alignment.
7. What is a storage device? Mention its types.
8. What is Operating System.
9. Write any four cell formulas used in ms word.
10. Explain how to check spellings in ms word.

PART-C (6 MARK)

1. What are the characters of Computer? Explain about them.
2. Explain Components of Computer with neat diagram.
3. Discuss about output devices.
4. Elaborate about different types of operating system.
5. Illustrate about font style and font size.
6. Narrate about Special Symbols in ms word.
7. Explain how to insert clip art into the word file.
8. Discuss about Bullets and Numbering.
9. Illustrate about different steps in Mail merge
10. Explain about Templates in ms word.

60	Scheduling of threads are done by_____	input	output	operating system	memory	operating system

UNIT-IISYLLABUS

MS Excel: Working with Spreadsheets – Opening, Saving files, Setting Margins, Converting files to different formats. **Entering and deleting data** – Entering data, Cut, Copy Paste, Undo, Redo, Highlighting values, Find, Search & Replace, Inserting Data, Insert cells, Columns, Rows & Sheets, Symbols, Clipart. **Formatting Spreadsheets** – Formatting- Alignment, Font, Border & Shading, Hiding/Locking Cells, Inserting Header and Footer, changing Sheet Name, Modifying Row height and Column width, Formatting and Style, Sheet background, Colour etc **Working with sheets** – Sorting, Filtering. **Creating Charts** – Bar Chart, Pie Chart, Line Chart. **Printing**.

Working with Spreadsheets:

Excel allows you to create worksheets much like paper ledgers that can perform automatic calculations. Each Excel file is a workbook that can hold many worksheets. The worksheet is a grid of columns (designated by letters) and rows (designated by numbers). The letters and numbers of the columns and rows (called labels) are displayed in gray buttons across the top and left side of the worksheet. The intersection of a column and a row is called a cell. Each cell on the spreadsheet has a cell address that is the column letter and the row number. Cells can contain text, numbers, or mathematical formulas.

Opening, Saving files

(A) You can open an existing File by several methods:

1. Go to windows explorer and find out the file you want to open. Double-click on the file.
2. Start MS Excel. Click on office button on the drop-down menu click 'open'. select the file you want to open from the pop-up menu.

(B) When you have finished your work on the file you can save it by either clicking on the 'file save' icon at the top left corner or Click on office button → click on save at the drop-down menu.

(C) When you are saving the worksheet for the first time follow the steps given below:

1. Click office button
2. Select 'file save as' on the drop-down menu.
3. On the pop-up menu select the location where you want to save the file.
4. Type the file name
5. Click on 'save' in the pop-up menu.

When your work is finished and it has been saved properly: Select Print from Office Button 

Setting Margins

Change the top, bottom, left, and right margins by selecting Margins from the page setup group of the Layout Tab. Enter values in the header and footer fields to indicate how far from the edge of the page this text should appear. Check the boxes for centering horizontally or vertically on the page.

There are three predefined margin settings. You can choose from them or you can also customize the margins as shown by the following diagram.

Converting files to different formats

Most of the time, you'll probably want to save your workbooks in the current file format (.xlsx). But sometimes, you might need to save a workbook in another file format, like the file format of an earlier version of Excel, a text file, or a PDF or XPS file. Just keep in mind that whenever you save a workbook in another file format, some of its formatting, data, and features might not be saved.

- ☐ Open the workbook you want to save.
- ☐ Click **File > Save As**.

- ☐ Under **Places**, pick the place where you want to save the workbook. For example, pick **OneDrive** to save it to your Web location or **Computer** to save it in a local folder like your **Documents**.

- ☐ In the **Save As** dialog box, navigate to the location you want.

- ☐ In the **Save as type** list, click the file format you want. Click the arrows to scroll to file formats that aren't visible in the list.

Note: The file formats you'll see vary, depending on what type of sheet is active in your workbook (a worksheet, chart sheet, or other type of sheet).

- ☐ In the **File name** box, accept the suggested name or type a new name for the workbook.

Entering and Deleting Data

Entering data

You can enter various kinds of data in a cell.

1. Numbers: Your numbers can be from the entire range of
numeric values: whole numbers (example, 25), decimals (example, 25.67) and scientific notation (example, 0.2567E+2). Excel displays scientific notation automatically if you enter a number that is too long to be viewed in its entirety in a cell. You may also see number signs (#####) when a cell entry is too long. Widening the column that contains the cell with the above signs will allow you to read the number.
2. Text: First select the cell in which data has to be entered and type the text. Press ENTER key to finish your text entry. The text will be displayed in

the active cell as well as in the Formula bar. If you have numbers to be treated as text use an apostrophe (') as the first character. You cannot do calculations with these kind of data entry.

3. **Date and Time:** When you enter dates and times, Excel converts these entries into serial numbers and kept as background information. However, the dates and times will be displayed to you on the worksheet in a format opted by you.
4. **Data in Series:** You can fill a range of cells either with the same value or with a series of values with the help of AutoFill.

Cut, Copy, Paste:

To copy and paste cell content:

Excel allows you to **copy** content that is already entered into your spreadsheet and **paste** that content to other cells, which can save you time and effort.

1. Select the **cell(s)** you want to **copy**.

2. Click the **Copy** command on the **Home** tab, or press **Ctrl+C** on your keyboard.

3. Select the **cell(s)** where you want to **paste** the content. The copied cells will now have a **dashed box** around them.

4. Click the **Paste** command on the **Home** tab, or press **Ctrl+V** on your keyboard.

5. The content will be **pasted** into the selected cells.

D	E
Friday, March 01, 2013	Friday, March 08, 2013
x	x

To cut and paste cell content:

Unlike copying and pasting, which **duplicates** cell content, **cutting** allows you to **move** content between cells.

1. Select the **cell(s)** you want to **cut**.

D	E
Friday, March 01, 2013	Friday, March 08, 2013
x	x
	x
	x
	x

2. Click the **Cut** command on the **Home** tab, or press **Ctrl+X** on your keyboard.

3. Select the cells where you want to **paste** the content. The cut cells will now have a **dashed box** around them.

4. Click the **Paste** command on the **Home** tab, or press **Ctrl+V** on your keyboard.

5. The cut content will be **removed** from the original cells and **pasted** into the selected cells.

D	E
Friday, March 01, 2013	Friday, March 08, 2013
x	x
x	
x	
x	

To access more paste options:

You can also access **additional paste options**, which are especially convenient when working with cells that contain **formulas** or **formatting**.

- To access more paste options, click the **drop-down arrow** on the **Paste** command.

Rather than choose commands from the Ribbon, you can access commands quickly by **right-clicking**. Simply select the **cell(s)** you want to **format**, then right-click the mouse. A **drop-down menu** will appear, where you'll find several **commands** that are also located on the Ribbon.

Undo, Redo:

- ☐ **Undo** - *undoes* a number of recent actions in a worksheet - such as deletions, formatting changes, data moves, or formula edits.
- ☐ By default, the Undo button is located on the Quick Access Toolbar, as shown in the image above.
- ☐ **Keyboard shortcut:** *Ctrl + z*
- ☐ **Redo** - re-apply or undo what you just undid. If you change your mind about changes you have just made to a worksheet with the *Undo command*, you can re-apply one or more changes with *Redo*.
- ☐ By default, the *Redo* button located next to *Undo* on the *Quick Access Toolbar*.
- ☐ **Keyboard shortcut:** *Ctrl + y*

Highlighting Values:

Select the **Home tab** in the toolbar at the top of the screen. Then in the **Styles group**, click on the Conditional Formatting drop-down and select *Manage Rules*.

When the Conditional Formatting Rules Manager window appears, click on the "New Rule" button to enter the first condition.

When the New Formatting Rule window appears, select **Format only top or bottom ranked values** as the rule type.

Then select **Top** in the first drop down, and enter **1** in the final box. In our example, we've selected only the first top value.

Next, we need to select what formatting to apply when this condition is met. To do this, click on the Format button.

When the Format Cells window appears, select the Fill tab. Then select the color that you'd like to see for the highest value in the range. In this example, we've selected green. Then click on the OK button.

When you return to the New Formatting Rule window, you should see the preview of the formatting in the Preview box. In this example, the preview box shows green as the fill color. Next click on the OK button.

This will return you to the Conditional Formatting Rules Manager window.

You will need to click on the New Rule button again.

When the New Formatting Rule window appears, we need to set up the second condition.

Select **Format only top or bottom ranked values** as the rule type.

Then select **Bottom** in the first drop down, and enter **1** in the final box. In our example, we've selected only the first bottom value.

Next, we need to select what formatting to apply when this second condition is met. To do this, click on the Format button.

When the Format Cells window appears, select the Fill tab. Then select the color that you'd like to see for the lowest value in the range. In this example, we've selected red. Then click on the OK button.

When you return to the New Formatting Rule window, you should see the preview of the formatting in the Preview box. In this example, the preview box shows red as the fill color. Next click on the OK button.

Your Conditional Formatting window should now look like this.

Click on the OK button.

Now when you return to the spreadsheet, the conditional formatting will be applied. As you can see, the -3 value appears in a red cell while the 200 value appears in a green cell.

Find, Search and Replace:

- ☐ On the **Home** tab, in the **Editing** group, click **Find & Select**.

- ☐ Do one of the following:
 - To find text or numbers, click **Find**.
 - To find and replace text or numbers, click **Replace**.
- ☐ In the **Find what** box, type the text or numbers you want to search for, or click the arrow in the **Find what** box, and then click a recent search in the list.

You can use wildcard characters, such as an asterisk (*) or a question mark (?), in your search criteria:

- Use the asterisk to find any string of characters. For example, **s*d** finds "sad" and "started".
- Use the question mark to find any single character. For example, **s?t** finds "sat" and "set".

Tip: You can find asterisks, question marks, and tilde characters (~) in worksheet data by preceding them with a tilde character in the **Find what** box. For example, to find data that contain "?", you would type ~? as your search criteria.

☐ Click **Options** to further define your search if needed:

- To search for data in a worksheet or in an entire workbook, in the **Within** box, select **Sheet** or **Workbook**.
- To search for data in rows or columns, in the **Search** box, click **By Rows** or **By Columns**.
- To search for data with specific details, in the **Look in** box, click **Formulas**, **Values**, or **Comments**.

Note: **Formulas**, **Values** and **Comments** are only available on the **Find** tab; only **Formulas** are available on the **Replace** tab.

- To search for case-sensitive data, select the **Match case** check box.
- To search for cells that contain just the characters that you typed in the **Find what** box, select the **Match entire cell contents** check box.

☐ If you want to search for text or numbers with specific formatting, click **Format**, and then make your selections in the **Find Format** dialog box.

Tip: If you want to find cells that just match a specific format, you can delete any criteria in the **Find what** box, and then select a specific cell format as an example. Click the arrow next to **Format**, click **Choose Format From Cell**, and then click the cell that has the formatting that you want to search for.

☐ Do one of the following:

- To find text or numbers, click **Find All** or **Find Next**.

Tip: When you click **Find All**, every occurrence of the criteria that you are searching for will be listed, and clicking a specific occurrence in the list will make a cell active. You can sort the results of a **Find All** search by clicking a column heading.

- To replace text or numbers, type the replacement characters in the **Replace with** box (or leave this box blank to replace the characters with nothing), and then click **Find** or **Find All**.

Note: If the **Replace with** box is not available, click the **Replace** tab.

If needed, you can cancel a search in progress by pressing ESC.

To replace the highlighted occurrence or all occurrences of the found characters, click **Replace** or **Replace All**.

Inserting Data

For **inserting data** in **MS Excel**, just activate the cell type text or number and press enter or Navigation keys.

Insert Cells,Columns, Rows:

If you need to add new data within an existing Excel worksheet, you can insert new cells, columns, or rows in the worksheet rather than going through all the trouble of moving and rearranging several individual cell ranges.

To insert new cells, rows, or columns in an Excel worksheet, follow these steps:

1. Select the cells, rows, or columns where you want the new, blank cells to appear.
2. Click the drop-down arrow attached to the Insert button in the Cells group of the Home tab.
3. Click Insert Cells on the drop-down menu.

The Insert dialog box opens with the following options:

- **Shift Cells Right** shifts existing cells to the right to make room for the blank cells you want to insert.
- **Shift Cells Down** instructs Excel to shift existing cells down. This is the default option.
- **Entire Row** inserts complete rows in the cell range. You can also select the row number on the frame before you choose the Insert command.
- **Entire Column** inserts complete columns in the cell range. You can also select the column letter on the frame before you choose the Insert command.

To quickly insert an entire column or row into the worksheet, you can right-click the column letter or row number on the worksheet window frame and then select Insert from the shortcut menu (or choose Insert Sheet Rows or Insert Sheet Columns from the Insert button's menu).

Keep in mind that inserting entire columns and rows affects the entire worksheet, not just the part you see. If you don't know what's out in the hinterlands of the worksheet, you can't be sure how the insertion will impact stuff (especially formulas) in the other unseen areas.

Inserting Sheets:

The worksheets in a workbook are accessible by clicking the worksheet tabs just above the status bar. By default, three worksheets are included in each workbook. One can add more worksheet in a workbook also. To do that

Insert a new worksheet

To quickly insert a new worksheet at the end of existing worksheets

Click the Insert Worksheet tab as shown below (encircled with blue circle)

To insert a new worksheet before an existing worksheet,

Select the worksheet before which you want to insert a new worksheet then follow steps as

1. Select Home tab
2. Click cells Group
3. Click Insert
4. Click Insert Sheet

Say if you want to insert a new worksheet before a sheet name Physics

A new sheet by the name sheet1 is added before the work sheet named Physics.

Alternative Method to Insert a new worksheet

- Right click on the sheet before which you want to insert a new sheet
- Select Insert Option from Pop up Menu

Inserting Symbols

Excel makes it easy to enter symbols, such as foreign currency marks, as well as special characters, like trademark and copyright symbols, into cells. These symbols are available in the Symbol dialog box. To add a special symbol or character to a cell entry, follow these steps:

1.Click the Insert tab and then click the Symbol button in the Symbols group.

The Symbol dialog box appears. The Symbol dialog box contains two tabs: Symbols and Special Characters.

2.(Optional) Click the Font drop-down list button and select a different font.

Check out the Wingdings and Webdings fonts to see a wide variety of symbols that you won't find with most other common fonts.

3.(Optional) Click the Subset drop-down list button and select the desired character set.

These subsets include foreign alphabets, accented characters, and mathematical operators.

4.Select the desired symbol on the Symbols tab; or click the Special Characters tab and select the desired character.

Notice that the most recently used symbols appear near the bottom of the Symbols tab.

5.Click Insert to insert the symbol or character.

The Symbol dialog box stays open so you can insert a string of special characters without having to re-open the dialog box for each one. Repeat steps 2 through 5 for each character or symbol you want to insert.

6.Click Close when you're done adding symbols and special characters.

The inserted symbols or characters appear in the worksheet.

7.Press Enter to complete the cell entry.

If you need to add more (regular) text to the cell entry, you can continue typing after you click Close and before you press Enter.

Inserting Clipart

Clip art is the name given to the ready-made illustrations offered by Microsoft for use in its various Microsoft Office programs, including Excel 2013. Clip art drawings are now so numerous that the images cover almost every classification of image that you can think of.

To locate the clip(s) you want to insert into the current worksheet in the Insert Pictures dialog box, in the Office.com Clip Art text box, type in a keyword describing the type of image you need and then press Enter or click the Search button (with the magnifying glass icon).

Excel 2013 then displays a scrollable list of thumbnails for all the clip art images that match your keyword in the Insert Pictures dialog box. Click a thumbnail in the list to display a short description plus the size (in pixels) of the image in the lower-left corner of the Insert Pictures dialog box.

To get a better view of a particular image whose thumbnail you've highlighted or selected in the list, click the View Larger button that appears in the thumbnail's lower-right corner (the magnifying glass with a plus sign in it). Excel then displays a slightly larger version of the thumbnail in the center of the dialog box while at the same time blurring out all the other thumbnails in the background.

To insert a particular clip art image into the current worksheet, double-click its thumbnail if it's not already selected in the list. If the thumbnail is selected, you can insert it by clicking the Insert button or by pressing Enter.

Formatting Spreadsheets:

Formatting

Formatting Spreadsheets in Excel

This article will cover the basics involved in formatting a Microsoft Excel worksheet including formatting of cells, use of styles, merging and alignment, fonts and conditional formatting. Once completed you should be able to professionally format a worksheet so that it can be used in presentations.

Good formatting will help enhance your data in several ways:

- Formatting cells so they present data correctly (example: formatting as dates or currency) will give more value to your data.

- Using styles (such as table styles) can make your data stand out and helps the reader to focus on important parts of the worksheet.
- Merging and aligning your data is an important aspect of making your data more readable.
- Formatting your text by increasing the size, adding italics, bolding or changing the fonts will enhance the overall look of your worksheet.
- Conditional formatting is a great tool that allows you to graphically or visibly highlight important areas of your worksheet – as these tools are dynamic, as your data changes so does the highlighted area.

How to Format Cells in Microsoft Excel

The diagrams below show the various tabs in the Format Cells Dialogue Box:

Click thumbnail to view full-size

There are many different ways to format cells within Microsoft Excel:

- Right clicking on a cell will show a menu with the most common formatting tools, plus a more detailed menu – on this detailed menu is an option to ‘Format Cells’ – clicking on this will open up the main Format Cells Dialog Box
- On the Home Tab of the ‘Ribbon’ is a Cells section. Clicking the small arrow beneath Format shows a small menu of formatting options – clicking the ‘Format Cells’ option will open up the main Format Cells Dialog Box.
- On the Home Tab there are various sections such as Font, Alignment, Number etc – these provide the most common elements from the main Format Cells Dialog Box – clicking the small arrow at the bottom right of each of these sections (where appropriate) opens the full dialog box.

The Format Cells Dialog Box contains the following tabs:

Number – How to change the Number Format in Microsoft Excel

Click thumbnail to view full-size

General:	41183					
Number:	41183	41183	41183	41183		
Currency:	41183	41183	41183	41183	41183	41183
Accounting:	41183					
	123					
	550000					
Date:	41183	41183	41183			
Time:	41183	41183	41183			
Percentage:	0.98	0.98				
Fraction:	0.5	0.3	0.6775599			
Scientific:	1000123	1000123				
Text:	123456					
Special:	111254303	7321234567	7111	71111234		
Custom:	1.23457E+14	12345678987				

Diagram 1: A simple worksheet with no number formatting. | Source

One of the most important factors when formatting a worksheet is the format of a number. Without formatting, a number is simply a measure – when proper number formatting is applied it becomes information. When formatting is applied the reader will instantly know what the number signifies.

The Number section within the Format Cells dialog box contains the following categories:

- **General** – this formats the cell with no specific number format.
- **Number** – this formats the cell as a number and allows customization of number of decimal places, whether to use a 1000 separator and how to display negative values.
- **Currency** – this formats the cell as a specific currency and allows customization of number of decimal places, the currency and how to show negative values.
- **Accounting** – this formats the cell as specific currency and also aligns the currency symbols and decimal points in a column. It allows for customization of the decimal places or the currency.

- **Date** – the formats the cell as a date. It allows varying styles of dates and the ability to select a locale.
- **Time** – the formats the cell as a time. It allows varying styles of time and the ability to select a locale.
- **Percentage** – this multiplies the cell value by 100 and displays the result with a percent symbol.
- **Fraction** – displays decimals as fractions. It allows for customization of the type of fraction – one digit, two digits, three digits, halves, quarters etc.
- **Scientific** – displays the cell in standard scientific format. It allows for customization of the decimal places.
- **Text** – treats all entries as text and will display cells as entered.
- **Special** – formats the cell using special formats such as Zip Code, Phone Number or SSN.
- **Custom** – allows for customization of the standard format codes.

Alignment:

To change text alignment in Excel, select the cell(s) you want to realign, go to the *Home* tab > *Alignment* group, and choose the desired option:

Vertical alignment

If you'd like to align data vertically, click one of the following icons:

- **Top Align**  - aligns the contents to the top of the cell.
- **Middle Align**  - centers the contents between the top and bottom of the cell.
- **Bottom Align**  - aligns the contents to the bottom of the cell (the default one).

Please note that changing vertical alignment does not have any visual effect unless you increase the row height.

Horizontal alignment

To align your data horizontally, Microsoft Excel provides these options:

- **Align Left**  - aligns the contents along the left edge of the cell.
- **Center**  - puts the contents in the middle of the cell.
- **Align Right**  - aligns the contents along the right edge of the cell.

By combining different vertical and horizontal alignments, you can arrange the cell contents in different ways, for example:

Align to upper-left

Align to bottom-right

Center in the middle of a cell

Change text orientation (rotate text)

Click the **Orientation** button on the *Home* tab, in the *Alignment* group, to rotate text up or down and write vertically or sideways. These options come in especially handy for labeling narrow columns:

Shortcut keys for alignment in Excel

To change alignment in Excel without lifting your fingers off the keyboard, you can use the following handy shortcuts:

- Top alignment - Alt + H then A + T
- Middle alignment - Alt + H then A + M
- Bottom alignment - Alt + H then A + B
- Left alignment - Alt + H then A + L
- Center alignment - Alt + H then A + C
- Right alignment - Alt + H then A + R

At first sight, it looks like a lot of keys to remember, but upon a closer look the logic becomes obvious. The first key combination (Alt + H) activates the *Home* tab. In the second key combination, the first letter is always "A" that stands for "alignment", and the other letter denotes the direction, e.g. A + T - "align top", A + L - "align left", A + C - "center alignment", and so on.

Font:

Setting Font from Home

You can set the font of the selected text from **Home » Font group » select the font.**

Setting Font From Format Cell Dialogue

- Right click on cell » Format cells » Font Tab
- Press Control + 1 or Shift + Control + F

Border & Shading:

Apply Borders

MS Excel enables you to apply borders to the cells. For applying border, select the range of cells **Right Click » Format cells » Border Tab » Select the Border Style**.

Then you can apply border by Home Tab » Font group » Apply Borders.

Apply Shading

You can add shading to the cell from the **Home tab » Font Group » Select the Color.**

Apply cell border:

1. Select the cell or range of cells that you want to add a border to.

Tip To quickly select the whole worksheet, click the **Select All** button.

2. On the **Home** tab, in the **Font** group, click the arrow next to **Borders**, and then click the border style that you want.

Tip The **Borders** button displays the most recently used border style. You can click the **Borders** button (not the arrow) to apply

Apply cell shading:

1. Select the cell or range of cells that you want to apply cell shading to.
2. On the **Home** tab, in the **Font** group, click the arrow next to **Fill Color**, and then under **Theme Colors** or **Standard Colors**, click the color that you want. that style.

Hiding and Locking cells

You can **lock cells** in **Excel** if you want to protect cells from being edited. In this example, we will lock cell A2.

A2					
=A1*2					
	A	B	C	D	E
1	5				
2	10				
3					

Before you start: by default, all cells are **locked**. However, locking cells has no effect until you protect the worksheet. So when you protect a worksheet, all your cells (=worksheet) will be locked. As a result, if you want to lock a cell, you have to unlock all cells first, lock a cell, and then protect the sheet.

1. Select all cells.

	A	B	C	D	E
1	5				
2	10				
3					

2. Right click, and then click Format Cells.
3. On the Protection tab, uncheck the Locked check box and click OK.

4. Right click cell A2, and then click Format Cells.
5. On the Protection tab, check the Locked check box and click OK.

Note: if you also check the Hidden check box, users cannot see the formula in the formula bar when they select cell A2.

6. Protect the sheet.

Cell A2 is locked now. To edit cell A2, you have to unprotect the sheet. The password for the downloadable Excel file is "easy". You can still edit all other cells.

Inserting Header and Footer:

Add or change the header or footer text: For worksheets, you can work with headers and footers in Page Layout view. For other sheet types, such as chart sheets or for embedded charts, you can work with headers and footers in the Page Setup dialog box.

1. Add or change the header or footer text for a worksheet in Page Layout view
2. Click the worksheet to which you want to add headers or footers, or that contains headers or footers that you want to change.

3. On the Insert tab, in the Text group, click Header & Footer.

Do one of the following:

- To add a header or footer, click the left, center, or right header or footer text box at the top or at the bottom of the worksheet page.

- To change a header or footer, click the header or footer text box at the top or at the bottom of the worksheet page that contains header or footer text, and then select the text that you want to change.
- Type the text that you want.
- To close the headers or footers, click anywhere in the worksheet, or press ESC.

Changing Sheet name:

To rename a worksheet

1. To rename a worksheet follow the steps as
2. Right click on the worksheet tab which you want to rename
3. Select rename from the Pop Up menu
4. Type new name for the Worksheet (Chemistry in our example)

Modifying Row height and Column width:

Set a column to a specific width

Select the column or columns that you want to change.

On the Home tab, in the Cells group, click Format.

1. Under Cell Size, click Column Width.
2. In the Column width box, type the value that you want.

Change the column width to fit the contents

1. Select the column or columns that you want to change.
2. On the Home tab, in the Cells group, click Format.
3. Under Cell Size, click AutoFit Column Width.
4. To quickly autofit all columns on the worksheet, click the Select All button and then double-click any boundary between two column headings.

Match the column width to another column

1. Select a cell in the column.
2. On the Home tab, in the Clipboard group, click Copy, and then select the target column.
3. On the Home tab, in the Clipboard group, click the arrow below Paste, and then click Paste Special.

1. Under Paste, select Column widths.

Change the width of columns by using the mouse

Do one of the following:

2. To change the width of one column, drag the boundary on the right side of the column heading until the column width changes to the desired size that you want.
3. To change the width of multiple columns, select the columns that you want to change, and then drag a boundary to the right of a selected column heading.

4. To change the width of columns to fit the contents, select the column or columns that you want to change, and then double-click the boundary to the right of a selected column heading.
5. To change the width of all columns on the worksheet, click the Select All button, and then drag the boundary of any column heading.

Set a row to a specific height

1. Select the row or rows that you want to change.
2. On the Home tab, in the Cells group, click Format.
3. Under Cell Size, click Row Height.
4. In the Row height box, type the value that you want.

Change the row height to fit the contents

1. Select the row or rows that you want to change.
2. On the Home tab, in the Cells group, click Format.
3. Under Cell Size, click AutoFit Row Height.
4. To quickly autofit all rows on the worksheet,
5. click the Select All button and then double-click the boundary below one of the row headings.

Change the height of rows by using the mouse

Do one of the following:

1. To change the row height of one row, drag the boundary below the row heading until the row is the height that you want.
2. To change the row height of multiple rows, select the rows that you want to change, and then drag the boundary below one of the selected row headings.
3. To change the row height for all rows on the worksheet, click the Select All button, and then drag the boundary below any row heading.

Formatting & Style Sheet background, Colour.

Using Built-In Styles

Excel has several built-in styles that you can use, so let's start with those. First, select the row of column headers in the first worksheet of the workbook (B4:F4).

	Quarter 1	Quarter 2	Quarter 3	Quarter 4	Total
Blue Mountain	\$ 2,346	\$ 1,493	\$ 1,550	\$ 3,037	\$ 8,426
Colombia	2,735	2,095	1,959	1,588	8,377
Ethiopia	1,408	2,345	2,242	1,714	7,709
Kona	1,043	2,743	2,283	2,397	8,466
Java	2,908	1,088	2,203	2,025	8,224
Sumatra	2,853	2,676	2,161	1,900	9,590
Total	\$ 13,293	\$ 12,440	\$ 12,398	\$ 12,661	\$ 50,792

Drag across the column headers to select them

On the Home tab of the ribbon bar, you'll find the styles on the right side. Depending on how wide your screen is, styles will either be a single button, or an area with a down arrow in the lower-right corner. Click whichever one you see (this screen capture is from the Windows version, and the Mac version is almost identical).

If the screen is narrow:

If the screen is wide:

The Cell Styles

section may appear differently, depending on how wide your screen is

Roll the mouse pointer over any of the styles to see a preview of how it looks on the worksheet (Windows, only). Note: the style names, like *Good*, *Bad*, and *Title*, are just suggested uses. You can use any style for any purpose you want.

In the Windows version, rolling over a style will give you a preview of how it will look

Click one to apply it to the selection, then click somewhere in the worksheet to deselect and get a better look.

	A	B	C	D	E	F
1	Friendly Grounds Coffee House					
2	Variety bean sales					
3						
4		Quarter 1	Quarter 2	Quarter 3	Quarter 4	Total
5	Blue Mountain	\$ 2,346	\$ 1,493	\$ 1,550	\$ 3,037	\$ 8,426
6	Colombia	2,735	2,095	1,959	1,588	8,377
7	Ethiopia	1,408	2,345	2,242	1,714	7,709
8	Kona	1,043	2,743	2,283	2,397	8,466
9	Java	2,908	1,088	2,203	2,025	8,224
10	Sumatra	2,853	2,676	2,161	1,900	9,590
11						
12	Total	\$ 13,293	\$ 12,440	\$ 12,398	\$ 12,661	\$ 50,792

Click somewhere on the worksheet to deselect and see the styles you applied

Now go to the second worksheet (Sales by Customer) and repeat: select the column headers along row 5 and apply the same style. Deselect to get a better look

	A	B	C	D	E	F	G	H
1	Friendly Grounds Coffee House							
2	Variety bean sales by customer							
3								
4								
5	First Name	Last Name	State	Variety	Price/lb.	Pounds	\$ Sale	
6	Jess	Altsisi	MI	Kona	\$11	4	\$44	
7	Yesenia	Andreadis	TX	Ethiopia	\$8	6	\$48	
8	Kari	Antenor	GA	Blue Mountair	\$12	9	\$108	
9	Maritza	Applen	PA	Blue Mountair	\$12	11	\$132	
10	Mara	Argue	MI	Ethiopia	\$8	9	\$72	
11	Emilio	Argueta	NY	Sumatra	\$9	9	\$81	
12	Bob	Arnholtz	AK	Java	\$7	5	\$35	
13	Nora	Asif	PA	Ethiopia	\$8	11	\$88	
14	Sofia	Aurich	CA	Blue Mountair	\$12	12	\$144	
15	Nanette	Axsom	NJ	Kona	\$11	11	\$121	
16	Eileen	Badura	MI	Sumatra	\$9	7	\$63	

Apply the same

style to the column headers of the second sheet

So far, it doesn't seem very impressive, but here's where it gets cool: changing the formatting by changing the style.

Modifying a Built-In Style

Select any of the cells you just formatted, then go back to the **Styles** drop-down and right-click the style you just applied. Select **Modify** from the pop-up menu.

Right-click a

style to modify it

The dialog box that appears shows what parts of the formatting are included in the style.

A style can include several different types of attributes

So for example, you might have a style that includes fonts and color information, but doesn't affect number formatting. Or vice-versa. For this example, we'll change the font, color and background, and add alignment to the style.

Click the **Format** button at the top of the dialog, and that brings up the regular Format Cells dialog. Make the following changes:

Alignment tab: set Horizontal alignment to Center

Center the headers horizontally

Font tab: choose a heavier weight font and slightly larger size (I chose Franklin Gothic Medium, 12 pt.), white color

Choose a different font and larger size

Fill tab: choose a dark color

Choose a dark

color fill

Click **OK**. Notice that the Style dialog box shows that Alignment is now part of the style. Click **OK** again.

Not only did the column headers change in the current workbook, but when you click the tab for the first workbook, you'll see they changed, also.

	A	B	C	D	E	F	G
1	Friendly Grounds Coffee House						
2	Variety bean sales						
3							
4		Quarter 1	Quarter 2	Quarter 3	Quarter 4	Total	
5	Blue Mountain	\$ 2,346	\$ 1,493	\$ 1,550	\$ 3,037	\$ 8,426	
6	Colombia	2,735	2,095	1,959	1,588	8,377	
7	Ethiopia	1,408	2,345	2,242	1,714	7,709	
8	Kona	1,043	2,743	2,283	2,397	8,466	
9	Java	2,908	1,088	2,203	2,025	8,224	
10	Sumatra	2,853	2,676	2,161	1,900	9,590	
11							
12	Total	\$ 13,293	\$ 12,440	\$ 12,398	\$ 12,661	\$ 50,792	
13							

The cells look different after you modify the style definition. Even better, you don't have to depend on the built-in styles. You can create your own.

Working with sheets:

Sorting & Filtering

There are many built-in Excel tools to help with data management and the sorting and filtering features are among the best. The filter tool gives you the ability to filter a column of data within a table to isolate the key components you need. The sorting tool allows you to sort by date, number, alphabetic order and more. In the following example, we will explore the usage of sorting and filtering and show some advanced sorting techniques.

For today's example, we will use the following spreadsheet:

Order Number	Product	Salesperson	Price	Date	Customer
333222	ABC	John Smith	\$100.00	2/3/2016	Eastern Company
333221	DEF	Rachel Adams	\$200.00	2/2/2016	Western Company
333223	ABC	John Smith	\$100.00	2/4/2016	Eastern Company
333220	XYZ	Cheryl Myers	\$800.00	2/1/2016	Southern Company
333119	GHI	Rachel Adams	\$300.00	1/31/2016	Northern Company
333224	JKL	Michael Brent	\$400.00	2/5/2016	Northern Company
333118	DEF	Cheryl Myers	\$200.00	1/30/2016	Western Company
333225	MNO	Dylan Rogers	\$500.00	2/6/2016	Eastern Company
333117	PQR	Michael Brent	\$600.00	1/29/2016	Southern Company
333226	STU	Cheryl Myers	\$700.00	2/7/2016	Northern Company
333116	ABC	Rachel Adams	\$100.00	1/28/2016	Western Company
333227	MNO	John Smith	\$500.00	2/3/2016	Eastern Company
333228	PQR	Rachel Adams	\$600.00	2/2/2016	Western Company
333229	ABC	John Smith	\$100.00	2/4/2016	Eastern Company
333230	XYZ	Cheryl Myers	\$800.00	2/1/2016	Southern Company
333231	DEF	Rachel Adams	\$200.00	1/31/2016	Northern Company
333232	STU	Michael Brent	\$700.00	2/5/2016	Northern Company
333233	GHI	Cheryl Myers	\$300.00	1/30/2016	Western Company
333234	DEF	Dylan Rogers	\$200.00	2/6/2016	Eastern Company
333235	ABC	Michael Brent	\$100.00	2/3/2016	Southern Company

As you can see, the order dates, order numbers, prices, etc. are all out of order. Let's get started on running some sorting and filtering techniques.

Sorting Data

Let's say you had the spreadsheet above and wanted to sort by price. This process is fairly simple. You can either highlight the whole column or even click on the first cell in the column to get started. Then you will:

- Right click to open the menu
- Go down to the Sort option – when hovering over Sort the sub-menu will appear
- Click on Largest to Smallest
- Select Expand the selection
- Click OK

Order Number	Product	Salesperson	Price	Date	Customer
333222	ABC	John Smith	\$100.00	2/3/2016	Eastern Company
333221	DEF	Rachel Adams	\$200.00	2/2/2016	Western Company
333223	ABC	John Smith	\$100.00	2/4/2016	Eastern Company
333220	XYZ	Cheryl Myers	\$800.00	2/1/2016	Southern Company
333119	GHI	Rachel Adams	\$300.00	1/31/2016	Northern Company
333224	JKL	Michael Brent	\$400.00	2/5/2016	Northern Company
333118	DEF	Cheryl Myers	\$200.00	1/30/2016	Western Company
333225	MNO	Dylan Rogers	\$500.00	2/6/2016	Eastern Company
333117	PQR	Michael Brent	\$600.00	1/29/2016	Southern Company
333226	STU	Cheryl Myers	\$700.00	2/7/2016	Northern Company
333116	ABC	Rachel Adams	\$100.00	1/28/2016	Western Company
333227	MNO	John Smith	\$500.00	2/3/2016	Eastern Company
333228	PQR	Rachel Adams	\$600.00	2/2/2016	Western Company
333229	ABC	John Smith	\$100.00	2/4/2016	Eastern Company
333230	XYZ	Cheryl Myers	\$800.00	2/1/2016	Southern Company
333231	DEF	Rachel Adams	\$200.00	1/31/2016	Northern Company
333232	STU	Michael Brent	\$700.00	2/5/2016	Northern Company
333233	GHI	Cheryl Myers	\$300.00	1/30/2016	Western Company
333234	DEF	Dylan Rogers	\$200.00	2/6/2016	Eastern Company
333235	ABC	Michael Brent	\$100.00	2/3/2016	Southern Company

The whole table has now adjusted for the sorted column. Note: when the data in one column is related to the data in the remaining columns of the table, you want to select Expand the selection. This will ensure the data in that row carries over with sorted column data.

Filtering Data

The filter feature applies a drop down menu to each column heading, allowing you to select specific choices to narrow a table. Using the above example, let's say you wanted to filter your table by Company and Salesperson. Specifically, you want to find the number of sales Dylan Rogers made to Eastern Company.

To do this using the filter you would:

- Go to the Data tab on Excel ribbon
- Select the Filter tool
- Select Eastern Company from the dropdown menu
- Select Dylan Rogers from the Salesperson dropdown menu

Order Number	Product	Salesperson	Price	Date	Customer
333222	ABC	John Smith	\$100.00	2/3/2016	Eastern Company
333221	DEF	Rachel Adams	\$200.00	2/2/2016	Western Company
333223	ABC	John Smith	\$100.00	2/4/2016	Eastern Company
333220	XYZ	Cheryl Myers	\$800.00	2/1/2016	Southern Company
333119	GHI	Rachel Adams	\$300.00	1/31/2016	Northern Company
333224	JKL	Michael Brent	\$400.00	2/5/2016	Northern Company
333118	DEF	Cheryl Myers	\$200.00	1/30/2016	Western Company
333225	MNO	Dylan Rogers	\$500.00	2/6/2016	Eastern Company
333117	PQR	Michael Brent	\$600.00	1/29/2016	Southern Company
333226	STU	Cheryl Myers	\$700.00	2/7/2016	Northern Company
333116	ABC	Rachel Adams	\$100.00	1/28/2016	Western Company
333227	MNO	John Smith	\$500.00	2/3/2016	Eastern Company
333228	PQR	Rachel Adams	\$600.00	2/2/2016	Western Company
333229	ABC	John Smith	\$100.00	2/4/2016	Eastern Company
333230	XYZ	Cheryl Myers	\$800.00	2/1/2016	Southern Company
333231	DEF	Rachel Adams	\$200.00	1/31/2016	Northern Company
333232	STU	Michael Brent	\$700.00	2/5/2016	Northern Company
333233	GHI	Cheryl Myers	\$300.00	1/30/2016	Western Company
333234	DEF	Dylan Rogers	\$200.00	2/6/2016	Eastern Company

Boom – you now have the exact number of sales Dylan Rogers made to Eastern Company.

The Sort & Filter Tool

In addition to the right-click menu sorting option and the Filter tool on the Data ribbon, Excel has a Sort & Filter tool that allows for custom sorting.

In the following GIF, we can see how the Custom Sorting tool can be used to sort date ranges or price ranges.

Excel Sorting & Filtering Data.xlsx - Excel

333234	DEF	Dylan Rogers	\$200.00	2/6/2016	Eastern Company

Sheet1

But notice how this example is either/or. What if you wanted to sort by date and by price? This where the Custom Sort option really comes in handy. After selecting your first sorting conditions, you can add a level to get even more accurate data:

Sheet1

Sort & Filter

- Sort A to Z
- Sort Z to A
- Custom Sort...
- Filter
- Clear
- Reapply

As you can see, Excel offers a variety of sorting and filtering tools to help you refine your data and keep it organized.

Creating Charts:

Bar Chart:

A bar chart is a graph that shows horizontal bars with the axis values for the bars displayed on the bottom of the graph.

It is a graphical object used to represent the data in your Excel spreadsheet.

You can use a bar chart when:

- You want to compare values across categories.
- The category text is long and difficult to display in a column chart.
- You want to show duration in a graph.

TechOnTheNet.com

Steps to Create a Bar Chart

To create a bar chart in Excel 2016, you will need to do the following steps:

1. Highlight the data that you would like to use for the bar chart. In this example, we have selected the range A1:C5.

TechOnTheNet.com

2. Select the **Insert** tab in the toolbar at the top of the screen. Click on the Bar Chart button  in the **Charts group** and then select a chart from the drop down menu. In this example, we have selected the first bar chart (called *Clustered Bar*) in the 2-D Column section.

TIP: As you hover over each choice in the drop down menu, it will show you a preview of your data in the highlighted chart format.

TechOnTheNet.com

- Now you will see the bar chart appear in your spreadsheet with horizontal bars to represent both the shelf life and restock time for each product. The shelf life (in days) is displayed as orange horizontal bars and the restock time (in days) is displayed as blue horizontal bars. You can see the axis values on the bottom of the graph for these horizontal bars.

TechOnTheNet.com

4. Finally, let's update the title for the bar chart.

To change the title, click on "Chart Title" at the top of the graph object. You should see the title become editable. Enter the text that you would like to see as the title. In this tutorial, we have entered "Product Life (in Days)" as the title for the bar chart.

Pie Chart:

A pie chart is a circle that is divided into slices and each slice represents a proportion of the whole.

It is a graphical object used to represent the data in your Excel spreadsheet that uses 1 series of data to create the graph.

You can use a pie chart when:

- You want to show numbers as a proportion of the whole (ie: the numbers equal 100%).
- There are a limited number of pie slices. If there are too many pie slices, then a pie chart is not a recommended graph to use.

Steps to Create a Pie Chart

To create a pie chart in Excel 2016, you will need to do the following steps:

1. Highlight the data that you would like to use for the pie chart. In this example, we have selected the range A1:B5.

2. Select the **Insert** tab in the toolbar at the top of the screen. Click on the Pie Chart button  in the **Charts group** and then select a chart from the drop down menu. In this example, we have selected the first pie chart (called *Pie*) in the 2-D Pie section.

TIP: As you hover over each choice in the drop down menu, it will show you a preview of your data in the highlighted chart format.

3. Now you will see the completed pie chart. In this tutorial, the pie chart has 4 slices (one for each division). Each slice represents the sales as a percentage of the total sales.

TechOnTheNet.com

Line Chart

A line chart is a graph that shows a series of data points connected by straight lines.

It is a graphical object used to represent the data in your Excel spreadsheet.

You can use a line chart when:

- You want to show a trend over time (such as days, months or years). In this case, the time values would be your categories.
- The order of your categories (ie: time values) is important.

TechOnTheNet.com

Steps to Create a Line Chart

To create a line chart in Excel 2016, you will need to do the following steps:

1. Highlight the data that you would like to use for the line chart. In this example, we have selected the range A1:D7.

TechOnTheNet.com

- Select the **Insert** tab in the toolbar at the top of the screen. Click on the Line Chart button  in the **Charts group** and then select a chart from the drop down menu. In this example, we have selected the fourth line chart (called *Line with Markers*) in the 2-D Line section.

TIP: As you hover over each choice in the drop down menu, it will show you a preview of your data in the highlighted chart format.

- Now you will see the line chart appear in your spreadsheet showing the trend for 3 products (ie: Desktops, Laptops and Tablets). The blue series of data points represents the trend for Desktops, the orange series of data points represents Laptops and the gray series of data points represents Tablets.

The axis values for each product are displayed on the left side of the graph.

TechOnTheNet.com

4. Finally, let's update the title for the line chart.

To change the title, click on "Chart Title" at the top of the graph object. You should see the title become editable. Enter the text that you would like to see as the title. In this tutorial, we have entered "Product Trends by Month" as the title for the line chart.

TechOnTheNet.com

Printing:

Sheet tab has the option to select the area to be printed (that is, range of cells). Check Gridlines if you want the gridlines dividing the cells to be printed on the page. If the worksheet is several pages long and only the first page includes titles for the columns, select Rows to repeat at top to choose a title row that will be printed at the top of each page.

PRINT PREVIEW

Print preview helps to view the worksheet before the final printout is taken. It helps to edit the worksheet if required as per the need.

The steps to see the print view of document

1. Select Print from Office Button .
2. Select print
3. Click Print Preview.

Click the buttons like Next and Previous with respect to Print Preview Tab. Select the Zoom button to view the pages closer. Make page layout modifications needed by clicking the Page Setup button. Click Close to return to the worksheet or Print to continue printing.

PRINT

To print the worksheet, select Print from Office Button  .

1. Print Range - Select either all pages or a range of pages to print.
2. Print What - Select selection of cells highlighted on the worksheet, the active worksheet, or all the worksheets in the entire workbook.
3. Copies - Choose the number of copies that should be printed. Check the Collate box if the pages should remain in order.
4. Click OK to print.

Possible Questions – UNIT II

PART –A (1MARK)

(Online Examinations)

PART- B (2 MARK)

1. What is Spreadsheet?
2. How to open an excel file?
3. How to change a sheet name?
4. How to cut and copy cell content?
5. Explain about Undo and Redo.
6. How to insert a new sheet before existing sheet?
7. What are the different ways to format cells?
8. Name any three types of chart.
9. How to print preview our sheet?
10. What is fill tab?

PART-C (6 MARK)

1. How to convert files to different formats?
2. Explain about entering data into the cells.
3. Discuss about modifying row height and column width.
4. Narrate about sorting and filtering.
5. Illustrate about creation of bar charts.
6. Explain about the insertion of rows and columns.
7. Discuss about Hiding and Locking Cells.
8. Elaborate about formatting spread sheets.
9. Briefly explain about Printing.
10. Narrate about Borders and Shading.

UNIT- II- MS Excel with Spreadsheets

S.NO	QUESTIONS	OPTION 1	OPTION 2	OPTION 3	OPTION 4	ANSWERS
1	The Software which contains rows and columns is called _____	Database	Drawing	Spreadsheet	Word processing	Spreadsheet
2	What is the short cut key to replace a data with another in sheet?	Ctrl + R	Ctrl + Shift + R	Ctrl + H	Ctrl + F	Ctrl + H
3	The key F12 opens a _____	Save As dialog box	Open dialog box	Save dialog box	Close dialog box	Save As dialog box
4	Which of the following is not a valid Zoom percentage in Excel?	10	100	300	500	500
5	The spelling tool is placed on _____ toolbar	Standard	Formatting	Drawing	Reviewing	Standard
6	You can automatically adjust the size of text in a cell if they do not fit in width by _____	Double clicking on the right border of column header	From Format choose Columns and then Auto fit Selection	From Format Cells dialog box mark Shrink fit	Decimal Places	From Format Cells dialog box mark Shrink fit
7	Formatting a cell in Currency, you can specify	Decimal Places	Currency	Adding	Symbol	Decimal Places
8	Formatting a cell in Number format you can't set	Decimal Places	Use 1000 separator	Negative numbers	Currency Symbol	Currency Symbol
9	What is entered by the function =today()	The date value for the day according to system clock	The time value according to system clock	Today's date as Text format	Today's day	The date value for the day according to system clock
10	Which function will you use to enter current time in a worksheet cell?	8/25/2018	NOW()	=time()	current Time()	NOW()
11	Merge cells option can be applied from	Format Cells dialog box Alignment Tab	Formatting toolbar	Both of above	None of above	Format Cells dialog box Alignment Tab
12	Pre-made sheet formats like Simple, Classic, Accounting, Colourful et can be applied from	from Format >> Cells	from Format >> Auto format	from Table >> Auto format	All of above	from Format >> Auto format
13	You can set Page Border in Excel from	From Border tab in Format Cells dialog box	From Border tool in Formatting toolbar	From Line Style tool in Drawing toolbar	You cannot set page border in Excel	You cannot set page border in Excel
14	When all the numbers between 0 and 100 in a range should be displayed in Red Colour, apply?	Use =if() function to format the required numbers red	Apply Conditional Formatting command on Format menu	Cell drag	use formulas	Apply Conditional Formatting command on Format menu
15	Which of the following is not true regarding Conditional Formatting?	You can add more than one condition to check	You can set condition to look for Bold and apply Italics on them.	You cannot set more function condition in same cell	You can drag the condition to another cell.	You can set condition to look for Bold and apply Italics on them.
16	Which of the following is invalid statement?	Sheet tabs can be coloured	Some picture can be applied as a background of a sheet	You can set the column width automatically fit the amount of text	The width of a row and be specified manually or fit automatically	The width of a row and be specified manually or fit automatically
18	Long text can be broken down into many lines within a cell.	Wrap Text in Format >> Cells	Justify in Edit >> Cells	Text Wrapping in Format >>	Wrapping in Format >> Cells	Wrap Text in Format >> Cells
19	MS Excel provides the default value for step in Fill Series dialog box	0	1	5	10	1
20	Ctrl + D shortcut key in Excel will-----	Open the font dialog box	Apply double underline for the active cell	Fill down in the selection	None of above	Fill down in the selection
21	The short cut key Ctrl + R is used in Excel to-----	Right align the content of cell	Remove the cell contents of selected cells	Fill the selection with active cells to the right	None of above	Fill the selection with active cells to the right
22	The command Edit >> Fill Across Worksheet is active _____	One sheet is selected	When many sheets are selected	When no sheet is selected	two sheet are selected	When many sheets are selected
23	Which of the following series type is not valid for Fill Series dialog box?	Linear	Growth	Autofill	Time	Time
24	Formulas in Excel start with	%	=	+	&	=
25	Paste Special allows some operation while you paste to new cell. Which of the following operation is valid?	Square	Percentage	Goal Seek	Divide	Divide
26	Edit >> Delete command is used to-----	Deletes the content of a cell	Deletes Formats of cell	Deletes the comment of cell	Deletes the selected cells	Deletes the selected cells
27	To remove the content of selected cells you must issue----- command	Edit >> Delete	Edit >> Clear >> Contents	Edit >> Clear >> All	Data >> Delete	Edit >> Clear >> Contents
28	The Delete key of keyboard is assigned to which command in Excel?	Edit >> Clear >> Contents	Edit >> Clear >> All	Edit >> Delete	Edit>>clear	Edit >> Clear >> Contents
29	To remove only the formatting done in a range numbers and formula_____	From Edit menu choose Clear and then Formats	From Edit menu choose Delete	Click on Remove Formatting tool on Standard Toolbar	Double click the Format Painter and then press Esc key in keyboard	From Edit menu choose Clear and then Formats
30	Which of the following action removes a sheet from workbook?	Select the sheet, then choose Edit >> Delete Sheet	Select the sheet then choose Format >> Sheet >> Hide	shift Delete	Delete button	Select the sheet, then choose Edit >> Delete Sheet
31	When you insert an Excel file into a Word document, the data are	Hyperlinked	Placed in a word table	Linked	Embedded	Placed in a word table

32	Except for the _____ function, a formula with a logical function shows the word “TRUE” or “FALSE” as a result	IF	AND	OR	NOT	IF
33	How are data organized in a spreadsheet?	Lines and spaces	Layers and planes	Rows and columns	Height and width	Rows and columns
34	Which of the following will not set text in selected cells to italics?	Pressing Ctrl + I on the keyboard	Web Form menu item	Font menu item	None of the above	Web Form menu item
35	Which of the following setup options cannot be set in the page setup dialog box?	Printer selection	Vertical or horizontal placement	Orientation	Row and column titles	Printer selection
36	What term refers to a specific set of values saved with the workbook?	Range Scenario	Scenario	Trend line	What-if analysis	Scenario
37	Which of the following is not a basic step in creating a worksheet?	Save the workbook	Modify the worksheet	Enter text and data	Copy the worksheet	Copy the worksheet
38	To edit a chart_____	Triple click the chart object	Click and drag the chart object	Double click the chart object	Click the chart object	Double click the chart object
39	The open scenario Manager dialog box by choosing scenarios from the menu.	View	Insert	Format	Tools	Tools
40	A _____ application is a computer program has a user interface comprised of a grid of rows and columns.	database	spreadsheet	matrix	tabular	spreadsheet
41	The intersection of a row and column is called a _____.	container	chamber	cubicle	cell	cell
42	A _____ is a grid of columns and rows in which data is entered	database	presentation	document	worksheet	worksheet
43	Formulas and functions begin with a(n) _____ sign.	#	.=	&	@	.=
44	Which of the following is NOT a type of data that can be contained in a cell?	Formulas	Functions	Text	Subroutines	Subroutines
45	The file extension for Microsoft Excel 2016 workbooks is _____.	.xlsx	.xls	.xls	.xlsx	.xlsx
46	When there are multiple worksheets, you can use the keyboard shortcut Ctrl + _____ to move one worksheet to right	Home	End	End	PgUp	PgDn
47	The keyboard shortcut to move one column to the left is _____.	Shift + Tab	Ctrl + Tab	Tab	Ctrl + Home	Shift + Tab
48	The keyboard shortcut to move to cell A1 is _____.	Home	Shift + Home	Alt + Home	Ctrl + Home	Ctrl + Home
49	To move right one screen, you would use the keyboard shortcut _____.	PgDn	Shift + PgDn	Ctrl + PgDn	Alt + PgDn	Alt + PgDn
50	A comment is indicated by the presence of a _____ in the upper-right corner of a cell	red square	green square	red triangle	green triangle	red square
51	To insert a comment into a cell, you click New Comment in the _____ tab	Comments group on the Review	Comments group on the Insert	Documentation group on the Review	Documentation group on the Insert	Comments group on the Review
52	Which of the following is NOT an example of worksheet documentation	Descriptive drop-down documentation menus	Descriptive worksheet names	Descriptive cell labels	Descriptive column titles	Descriptive drop-down documentation menus
53	The base date for date and time data in Excel 2016 is _____.	January 1, 1000	December 31, 999	December 31, 1899	January 1, 1900	January 1, 1900
54	Which of the following data types is NOT automatically right-aligned by Excel?	Numeric	Date	Text	Time	Text
55	If you enter a date or time that is not recognized, Excel treats the information as _____ and left-aligns it in the cell.	Numeric	Text	Date	Time	Text
56	If you click _____, the insertion point is displayed in the formula bar.	in a cell	in the formula bar	a worksheet tab	the Home tab	in the formula bar
57	The keyboard shortcut for Undo is _____.	Ctrl + Y	Ctrl + W	Ctrl + U	Ctrl + Z	Ctrl + Z
58	To insert a line break or hard return in a cell, you would press _____.	Ctrl + Enter	Enter	Alt + Enter	Shift + Enter	Alt + Enter
59	To open the scenario Manager dialog box by choosing the..... menu.	View	Insert	Format	Tools	Tools
60	To open the Sort dialog box by choosing the Menu	View	Format	Tools	Data	Data

4	Which of the following is not a valid Zoom percentage in Excel?	10	100	300	500	500
5	The spelling tool is placed on _____ toolbar	Standard	Formatting	Drawing	Reviewing	Standard
6	You can automatically adjust the size of text in a cell if they do not fit in width by _____	Double clicking on the right border of column header	From Format choose Columns and then Auto fit Selection	From Format Cells dialog box mark Shrink fit	Decimal Places	From Format Cells dialog box mark Shrink fit
7	Formatting a cell in Currency, you can specify	Decimal Places	Currency	Adding	Symbol	Decimal Places
8	Formatting a cell in Number format you can't set	Decimal Places	Use 1000 separator	Negative numbers	Currency Symbol	Currency Symbol
9	What is entered by the function =today()	The date value for the day according to system clock	The time value according to system clock	Today's date as Text format	Today's day	The date value for the day according to system clock
10	Which function will you use to enter current time in a worksheet cell?	8/25/2018	NOW()	=time()	current Time()	NOW()
11	Merge cells option can be applied from	Format Cells dialog box Alignment Tab	Formatting toolbar	Both of above	None of above	Format Cells dialog box Alignment Tab
12	Pre-made sheet formats like Simple, Classic, Accounting, Colourful et can be applied from	from Format >> Cells	from Format >> Auto format	from Table >> Auto format	All of above	from Format >> Auto format
13	You can set Page Border in Excel from	From Border tab in Format Cells dialog box	From Border tool in Formatting toolbar	From Line Style tool in Drawing toolbar	You cannot set page border in Excel	You cannot set page border in Excel
14	When all the numbers between 0 and 100 in a range should be displayed in Red Colour, apply?	Use =if() function to format the required numbers red	Apply Conditional Formatting command on Format menu	Cell drag	use formulas	Apply Conditional Formatting command on Format menu
15	Which of the following is not true regarding Conditional Formatting?	You can add more than one condition to check	You can set condition to look for Bold and apply Italics on them.	You cannot set more function condition in same cell	You can drag the condition to another cell.	You can set condition to look for Bold and apply Italics on them.
16	Which of the following is invalid statement?	Sheet tabs can be coloured	Some picture can be applied as a background of a sheet	You can set the column width automatically fit the amount of text	The width of a row and be specified manually or fit automatically	The width of a row and be specified manually or fit automatically
18	Long text can be broken down into many lines within a cell.	Wrap Text in Format >> Cells	Justify in Edit >> Cells	Text Wrapping in Format >>	Wrapping in Format >> Cells	Wrap Text in Format >> Cells
19	MS Excel provides the default value for step in Fill Series dialog box	0	1	5	10	1
20	Ctrl + D shortcut key in Excel will-----	Open the font dialog box	Apply double underline for the active cell	Fill down in the selection	None of above	Fill down in the selection
21	The short cut key Ctrl + R is used in Excel to-----	Right align the content of cell	Remove the cell contents of selected cells	Fill the selection with active cells to the right	None of above	Fill the selection with active cells to the right
22	The command Edit >> Fill Across Worksheet is active _____	One sheet is selected	When many sheets are selected	When no sheet is selected	two sheet are selected	When many sheets are selected
23	Which of the following series type is not valid for Fill Series dialog box?	Linear	Growth	Autofill	Time	Time
24	Formulas in Excel start with	%	=	+	&	=
25	Paste Special allows some operation while you paste to new cell. Which of the following operation is valid?	Square	Percentage	Goal Seek	Divide	Divide
26	Edit >> Delete command is used to-----	Deletes the content of a cell	Deletes Formats of cell	Deletes the comment of cell	Deletes the selected cells	Deletes the selected cells
27	To remove the content of selected cells you must issue----- command	Edit >> Delete	Edit >> Clear >> Contents	Edit >> Clear >> All	Data >> Delete	Edit >> Clear >> Contents
28	The Delete key of keyboard is assigned to which command in Excel?	Edit >> Clear >> Contents	Edit >> Clear >> All	Edit >> Delete	Edit>>clear	Edit >> Clear >> Contents
29	To remove only the formatting done in a range numbers and formula_____	From Edit menu choose Clear and then Formats	From Edit menu choose Delete	Click on Remove Formatting tool on Standard Toolbar	Double click the Format Painter and then press Esc key in keyboard	From Edit menu choose Clear and then Formats
30	Which of the following action removes a sheet from workbook?	Select the sheet, then choose Edit >> Delete Sheet	Select the sheet then choose Format >> Sheet >> Hide	shift Delete	Delete button	Select the sheet, then choose Edit >> Delete Sheet
31	When you insert an Excel file into a Word document, the data are	Hyperlinked	Placed in a word table	Linked	Embedded	Placed in a word table

32	Except for the _____ function, a formula with a logical function shows the word “TRUE” or “FALSE” as a result	IF	AND	OR	NOT	IF
33	How are data organized in a spreadsheet?	Lines and spaces	Layers and planes	Rows and columns	Height and width	Rows and columns
34	Which of the following will not set text in selected cells to italics?	Pressing Ctrl + I on the keyboard	Web Form menu item	Font menu item	None of the above	Web Form menu item
35	Which of the following setup options cannot be set in the page setup dialog box?	Printer selection	Vertical or horizontal placement	Orientation	Row and column titles	Printer selection
36	What term refers to a specific set of values saved with the workbook?	Range Scenario	Scenario	Trend line	What-if analysis	Scenario
37	Which of the following is not a basic step in creating a worksheet?	Save the workbook	Modify the worksheet	Enter text and data	Copy the worksheet	Copy the worksheet
38	To edit a chart_____	Triple click the chart object	Click and drag the chart object	Double click the chart object	Click the chart object	Double click the chart object
39	The open scenario Manager dialog box by choosing scenarios from the menu.	View	Insert	Format	Tools	Tools
40	A _____ application is a computer program has a user interface comprised of a grid of rows and columns.	database	spreadsheet	matrix	tabular	spreadsheet
41	The intersection of a row and column is called a _____.	container	chamber	cubicle	cell	cell
42	A _____ is a grid of columns and rows in which data is entered	database	presentation	document	worksheet	worksheet
43	Formulas and functions begin with a(n) _____ sign.	#	.=	&	@	.=
44	Which of the following is NOT a type of data that can be contained in a cell?	Formulas	Functions	Text	Subroutines	Subroutines
45	The file extension for Microsoft Excel 2016 workbooks is _____.	.xlsx	.xls	.xls	.xlsx	.xlsx
46	When there are multiple worksheets, you can use the keyboard shortcut Ctrl + _____ to move one worksheet to right	Home	End	End	PgUp	PgDn
47	The keyboard shortcut to move one column to the left is _____.	Shift + Tab	Ctrl + Tab	Tab	Ctrl + Home	Shift + Tab
48	The keyboard shortcut to move to cell A1 is _____.	Home	Shift + Home	Alt + Home	Ctrl + Home	Ctrl + Home
49	To move right one screen, you would use the keyboard shortcut _____.	PgDn	Shift + PgDn	Ctrl + PgDn	Alt + PgDn	Alt + PgDn
50	A comment is indicated by the presence of a _____ in the upper-right corner of a cell	red square	green square	red triangle	green triangle	red square
51	To insert a comment into a cell, you click New Comment in the _____ tab	Comments group on the Review	Comments group on the Insert	Documentation group on the Review	Documentation group on the Insert	Comments group on the Review
52	Which of the following is NOT an example of worksheet documentation	Descriptive drop-down documentation menus	Descriptive worksheet names	Descriptive cell labels	Descriptive column titles	Descriptive drop-down documentation menus
53	The base date for date and time data in Excel 2016 is _____.	January 1, 1000	December 31, 999	December 31, 1899	January 1, 1900	January 1, 1900
54	Which of the following data types is NOT automatically right-aligned by Excel?	Numeric	Date	Text	Time	Text
55	If you enter a date or time that is not recognized, Excel treats the information as _____ and left-aligns it in the cell.	Numeric	Text	Date	Time	Text
56	If you click _____, the insertion point is displayed in the formula bar.	in a cell	in the formula bar	a worksheet tab	the Home tab	in the formula bar
57	The keyboard shortcut for Undo is _____.	Ctrl + Y	Ctrl + W	Ctrl + U	Ctrl + Z	Ctrl + Z
58	To insert a line break or hard return in a cell, you would press _____.	Ctrl + Enter	Enter	Alt + Enter	Shift + Enter	Alt + Enter
59	To open the scenario Manager dialog box by choosing the..... menu.	View	Insert	Format	Tools	Tools
60	To open the Sort dialog box by choosing the Menu	View	Format	Tools	Data	Data

UNIT-III

SYLLABUS

Excel Functions: Date and Time Functions – Date, Time, Now, Today, Hour, Minute, Second, Day, Month, Year, Weekday, Mathematics, Statistics, Days. **Mathematical Functions** – Sum, Product, Power, SQRT, Subtotal. **Statistical Functions** – Count, Countif, Count blank, Average, Median, Mode, Standard deviation, Coefficient of Variation, Trend, Maximum, Minimum, Large, Small.

Date and Time Functions:

Date:

The syntax for the DATE function in Microsoft Excel is:

DATE(year, month, day)

Parameters or Arguments

Year: A number that is between one and four digits that represents the year.

Month: A number representing the month value. If the *month* value is greater than 12, then every 12 months will add 1 year to the *year* value. This means that DATE(2016,13,4) is equal to DATE(2017,1,4) and DATE(2016,25,4) is equal to DATE(2018,1,4) ... and so on.

Day: A number representing the day value. If the *day* value is greater than the number of days in the month specified, then the appropriate number of months will be added to the *month* value.

Returns

The DATE function returns a serial date value. A serial date is how Excel stores dates internally and it represents the number of days since January 1, 1900.

If the *year* is greater than 9999, the DATE function will return the #NUM! error.

Note

- If the *year* is between 0 and 1899, the year value is added to 1900 to determine the year.
- If the *year* is between 1900 and 9999, the DATE function uses the year value as the year.

The Microsoft Excel DATE function returns the serial date value for a date.

The DATE function is a built-in function in Excel that is categorized as a *Date/Time Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the DATE function can be entered as part of a formula in a cell of a worksheet.

Result from DATE function				
Year	Month	Day	Serial Date	Formatted Date
2016	8	31	42613	8/31/2016
2016	6	30	42551	6/30/2016
2016	1	4	42373	1/4/2016
2016	13	4	42739	1/4/2017

TechOnTheNet.com

Time:

The syntax for the TIME function in Microsoft Excel is:

TIME(hour, minute, second)

Parameters or Arguments

Hour: A number from 0 to 32767, representing the hour. If the *hour* value is greater than 23, it will be divided by 24 and the remainder will be used as the *hour* value. This means that TIME(24,0,0) is equal to TIME(0,0,0) and TIME(25,0,0) is equal to TIME(1,0,0) ... and so on.

Minute: A number from 0 to 32767, representing the minute. If the *minute* value is greater than 59, then every 60 minutes will add 1 hour to the *hour* value. This means that TIME(0,60,0) is equal to TIME(1,0,0) and TIME(0,120,0) is equal to TIME(2,0,0) ... and so on.

Second: A number from 0 to 32767, representing the second. If the *second* value is greater than 59, then every 60 seconds will add 1 minute to the *minute* value. This means that TIME(0,0,60) is equal to TIME(0,1,0) and TIME(0,0,120) is equal to TIME(0,2,0) ... and so on.

Returns

The TIME function returns a numeric value between 0 and 0.999988426.

Example

	A	B	C	D	E	F
1				Result from TIME function		
2	Hour	Minute	Second	Decimal Result	Default Format	Full Format
3	0	0	0	0	12:00 AM	12:00:00 AM
4	10	45	8	0.448009259	10:45 AM	10:45:08 AM
5	18	15	30	0.760763889	6:15 PM	6:15:30 PM
6	23	59	59	0.999988426	11:59 PM	11:59:59 PM
7	25	0	0	0.041666667	1:00 AM	1:00:00 AM
8	1	120	0	0.125	3:00 AM	3:00:00 AM
9	0	0	3600	0.041666667	1:00 AM	1:00:00 AM

TechOnTheNet.com

Now:

The Microsoft Excel NOW function returns the current system date and time.

The NOW function is a built-in function in Excel that is categorized as a *Date/Time Function*. It can be used as a worksheet function (WS) and a VBA function (VBA) in Excel. As a worksheet function, the NOW function can be entered as part of a formula in a cell of a worksheet. When used as a worksheet function, the NOW function will refresh the date/time value whenever the worksheet recalculates.

Syntax

The syntax for the NOW function in Microsoft Excel is:

NOW()

Parameters or Arguments

There are no parameters or arguments for the NOW function.

Returns

The NOW function returns a date value.

Example**Today:**

The Microsoft Excel TODAY function returns the current system date. This function will refresh the date whenever the worksheet recalculates.

The TODAY function is a built-in function in Excel that is categorized as a *Date/Time Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the TODAY function can be entered as part of a formula in a cell of a worksheet.

Syntax

The syntax for the TODAY function in Microsoft Excel is:

TODAY()

Parameters or Arguments

There are no parameters or arguments for the **TODAY function**.

Returns

The TODAY function returns a serial date value. A serial date is how Excel stores dates internally and it represents the number of days since January 1, 1900.

Example:**Hour:**

The Microsoft Excel HOUR function returns the hours (a number from 0 to 23) from a time value.

The HOUR function is a built-in function in Excel that is categorized as a *Date/Time Function*. It can be used as a worksheet function (WS) and a VBA function (VBA) in Excel. As a worksheet function, the HOUR function can be entered as part of a formula in a cell of a worksheet.

Syntax

The syntax for the HOUR function in Microsoft Excel is:

Hour(serial_number)

Parameters or Arguments

serial_number: The time value to extract the hour from. It may be expressed as a string value, a decimal number, or the result of a formula.

Returns

The HOUR function returns a numeric value between 0 and 23.

Example:**Minute:**

The Microsoft Excel MINUTE function returns the minutes (a number from 0 to 59) from a time value.

The MINUTE function is a built-in function in Excel that is categorized as a *Date/Time Function*.

Syntax

The syntax for the MINUTE function in Microsoft Excel is:

MINUTE(serial_number)

Parameters or Arguments

Serial_number: The time value to extract the minutes from. It may be expressed as a string value, a decimal number, or the result of a formula.

Returns

The MINUTE function returns a numeric value between 0 and 59.

Example

Let's look at some Excel MINUTE function examples and explore how to use the MINUTE function as a worksheet function in Microsoft Excel:

	A	B	C	D
1	Date Value	Result		
2	Mar 31, 2016 2:10 PM	10		
3	Apr 1, 2016 5:55 PM	55		
4	8:45 PM	45		
5	0:30	30		
6				
7				

TechOnTheNet.com

Second:

The Microsoft Excel SECOND function returns the seconds (a number from 0 to 59) from a time value.

The SECOND function is a built-in function in Excel that is categorized as a *Date/Time Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the SECOND function can be entered as part of a formula in a cell of a worksheet.

Syntax

The syntax for the SECOND function in Microsoft Excel is:

SECOND(serial_number)

Parameters or Arguments

serial_number: The time value to extract the second from. It may be expressed as a string value, a decimal number, or the result of a formula.

Returns

The SECOND function returns a numeric value between 0 and 59.

Example:**Day:**

The Microsoft Excel DAY function returns the day of the month (a number from 1 to 31) given a date value.

The DAY function is a built-in function in Excel that is categorized as a *Date/Time Function*.

Syntax

The syntax for the DAY function in Microsoft Excel is:

DAY(date_value)

Parameters or Arguments

date_value: A valid date to return the day of the month.

Returns

The DAY function returns a numeric value between 1 and 31.

Example:

DAY(A1)

Result: 1

=DAY(A2)

Result: 31

=DAY(A3)

Result: 15

=DAY("12/31/2011")

Result: 31

Month:

The Microsoft Excel MONTH function returns the month (a number from 1 to 12) given a date value.

The MONTH function is a built-in function in Excel that is categorized as a *Date/Time Function*. As a worksheet function, the MONTH function can be entered as part of a formula in a cell of a worksheet.

Syntax

The syntax for the MONTH function in Microsoft Excel is:

MONTH(date_value)

Parameters or Arguments

date_value: A valid date to return the month.

Returns

The MONTH function returns a numeric value between 1 and 12.

Example:

The screenshot shows an Excel spreadsheet with a table of order data. The formula bar at the top displays '=MONTH(B2)', and cell G1 contains the value '9', which is the month of the date in cell B2 (9/1/2012).

	A	B	C	D	E	F	G
1	Order ID	Order Date	Product	Unit Price	Quantity		9
2	10247	9/1/2012	Apples	\$14.00	12		
3	10249	8/31/2013	Oranges	\$9.80	10		
4	10250	4/14/2013	Bananas	\$34.80	5		
5	10251	8/1/2013	Pears	\$18.60	9		
6	10252	1/25/2016	Grapes	\$42.30	40		
7							

TechOnTheNet.com

Year:

The Microsoft Excel YEAR function returns a four-digit year (a number from 1900 to 9999) given a date value.

The YEAR function is a built-in function in Excel that is categorized as a *Date/Time Function*.

Syntax

The syntax for the YEAR function in Microsoft Excel is:

YEAR(date_value)

Parameters or Arguments

date_value: A valid date to return the year value.

Returns:

The YEAR function returns a numeric value between 1900 and 9999.

Example

=YEAR(A1)

Result: 1999

=YEAR(A2)

Result: 2001

=YEAR(A3)

Result: 2003

Weekday:

The Microsoft Excel WEEKDAY function returns a number representing the day of the week, given a date value.

The WEEKDAY function is a built-in function in Excel that is categorized as a *Date/Time Function*. It can be used as a worksheet function (WS) and a VBA function (VBA) in Excel. As a worksheet function, the WEEKDAY function can be entered as part of a formula in a cell of a worksheet. As a VBA function, you can use this function in macro code that is entered through the Microsoft Visual Basic Editor.

Syntax

The syntax for the WEEKDAY function in Microsoft Excel is:

WEEKDAY(serial_number, [return_value])

Parameters or Arguments

serial_number: A date expressed as a serial number or a date in quotation marks.

return_value: Optional. It determines the day to use as the first day of the week in the calculations.

alue	Explanation	Version
1	Returns a number from 1 (Sunday) to 7 (Saturday). This is the default if parameter is omitted.	
2	Returns a number from 1 (Monday) to 7 (Sunday).	
3	Returns a number from 0 (Monday) to 6 (Sunday).	
11	Returns a number from 1 (Monday) to 7 (Sunday).	* Introduced in Excel 2010
12	Returns a number from 1 (Tuesday) to 7 (Monday).	* Introduced in Excel 2010
13	Returns a number from 1 (Wednesday) to 7 (Tuesday).	* Introduced in Excel 2010
14	Returns a number from 1 (Thursday) to 7 (Wednesday).	* Introduced in Excel 2010
15	Returns a number from 1 (Friday) to 7 (Thursday).	* Introduced in Excel 2010
16	Returns a number from 1 (Saturday) to 7 (Friday).	* Introduced in Excel 2010
17	Returns a number from 1 (Sunday) to 7 (Saturday).	* Introduced in Excel 2010

Example:

WEEKDAY(A1)

Result: 1

=WEEKDAY(A1, 1)

Result: 1

=WEEKDAY(A1, 2)

Result: 7

=WEEKDAY(A2)

Result: 5

=WEEKDAY(A3)

Result: 6

=WEEKDAY("Apr 21, 2015")

Result: 3

Mathematical Functions:

Sum: The Microsoft Excel SUM function adds all numbers in a range of cells and returns the result. The SUM is a built-in function in Excel that is categorized as a *Math/Trig Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the SUM function can be entered as part of a formula in a cell of a worksheet.

Syntax:

SUM(number1, [number2, ... number_n])

OR

SUM (cell1:cell2, [cell3:cell4], ...)

Parameters or Arguments

Number: A numeric value that you wish to sum.

Cell: The range of cells that you wish to sum.

Returns: The SUM function returns a numeric value.

Note: You can sum combinations of both numbers and ranges of cells using the SUM function.

Example:

Product: The Microsoft Excel PRODUCT function multiplies the numbers and returns the product. The PRODUCT function is a built-in function in Excel that is categorized as a *Math/Trig Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the PRODUCT function can be entered as part of a formula in a cell of a worksheet.

Syntax

PRODUCT(number1, number2, ... number_n)

Parameters or Arguments

number1, number2, ... number_n

The numbers to multiply together. There can be up to 30 numbers entered.

Returns

The PRODUCT function returns a numeric value.

Example

Power: The Microsoft Excel POWER function returns the result of a number raised to a given power. The POWER function is a built-in function in Excel that is categorized as a *Math/Trig Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the POWER function can be entered as part of a formula in a cell of a worksheet.

Syntax

POWER(number, power)

Parameters or Arguments

Number: It is the base number.

Power: It is the exponent used to raise the base number to.

Returns

The POWER function returns a numeric value.

Example

SQRT: The Microsoft Excel SQRT function returns the square root of a number. The SQRT function is a built-in function in Excel that is categorized as a *Math/Trig Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the SQRT function can be entered as part of a formula in a cell of a worksheet.

Syntax

SQRT(number)

Parameters or Arguments

Number: A positive number that you wish to return the square root for.

Returns

The SQRT function returns a numeric value.

If a negative number is entered in the *number* parameter, the SQRT function will return the #NUM! error.

Example

Subtotal: The Microsoft Excel SUBTOTAL function returns the subtotal of the numbers in a column in a list or database. The SUBTOTAL function is a built-in function in Excel that is categorized as a *Math/Trig Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the SUBTOTAL function can be entered as part of a formula in a cell of a worksheet.

Syntax

SUBTOTAL(method, range1, [range2, ... range_n])

Parameters or Arguments

Method: The type of subtotal to create, but be careful which *method* you select. *method* can be a value ranging from 1 - 11 that includes hidden values or a value ranging from 101 - 111 that ignores hidden values in the calculation.

Value	Explanation (includes hidden values)
1	AVERAGE
2	COUNT
3	COUNTA

111	VARP

range1, range2, ... range_n: The ranges of cells that you want to subtotal.

Returns: The SUBTOTAL function returns a numeric value.

Example:

Statistical Functions:

Count: The Microsoft Excel COUNT function counts the number of cells that contain numbers as well as the number of arguments that contain numbers. The COUNT function is a built-in function in Excel that is categorized as a *Statistical Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the COUNT function can be entered as part of a formula in a cell of a worksheet.

Syntax

COUNT(argument1, [argument2, ... argument_n])

Parameters or Arguments

argument1, argument2, ... argument_n: Either ranges of cells or values. There can be up to 30 arguments.

Returns: The COUNT function returns a numeric value.

Example

Countif: The Microsoft Excel COUNTIF function counts the number of cells in a range, that meets a given criteria.

The COUNTIF function is a built-in function in Excel that is categorized as a *Statistical Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the COUNTIF function can be entered as part of a formula in a cell of a worksheet.

Syntax

COUNTIF(range, criteria)

Parameters or Arguments

Range: The range of cells that you want to count based on the *criteria*.

Criteria: The criteria used to determine which cells to count.

Returns

The COUNTIF function returns a numeric value.

Example

Count blank: The Microsoft Excel COUNTBLANK function counts the number of empty cells in a range.

The COUNTBLANK function is a built-in function in Excel that is categorized as a *Statistical Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the COUNTBLANK function can be entered as part of a formula in a cell of a worksheet.

Syntax

COUNTBLANK(range)

Parameters or Arguments

Range: The range of cells to count empty cells.

Returns

The COUNTBLANK function returns a numeric value.

Example

Average: The Microsoft Excel AVERAGE function returns the average (arithmetic mean) of the numbers provided.

The AVERAGE function is a built-in function in Excel that is categorized as a *Statistical Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the AVERAGE function can be entered as part of a formula in a cell of a worksheet.

Syntax

AVERAGE(number1, [number2], ... [number_n])

Parameters or Arguments

number1, number2, ... number_n: Numeric values that can be numbers, named ranges, arrays, or references to numbers. There can be up to 30 values entered.

Returns: The AVERAGE function returns a numeric value.

Example

Median: The Microsoft Excel MEDIAN function returns the median of the numbers provided.

The MEDIAN function is a built-in function in Excel that is categorized as a *Statistical Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the MEDIAN function can be entered as part of a formula in a cell of a worksheet.

Syntax

MEDIAN(number1, [number2, ... number_n])

Parameters or Arguments

number1:A numeric value that can be a number, named range, array, or reference to a number.

number2, ... number_n

Optional. Numeric values that can be numbers, named ranges, arrays, or references to numbers. There can be up to 30 values entered.

Returns

The MEDIAN function returns a numeric value.

Example

Mode: The Microsoft Excel MODE function returns the most frequently occurring number found in a set of numbers. This function has been replaced by the MODE.SNGL and MODE.MULT functions starting in Excel 2010.

The MODE function is a built-in function in Excel that is categorized as a *Statistical Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the MODE function can be entered as part of a formula in a cell of a worksheet.

Syntax

MODE(number1, [number2, ... number_n])

Parameters or Arguments

number1, number2, ... number_n: Each number can be a range, a cell or a numeric value. There can be up to 255 numbers.

Returns:

The MODE function returns a numeric value.

If all numeric values in the set are unique, the MODE function returns the #N/A error.

If a text value such as "A" is entered as a parameter, the MODE function will return the #VALUE! error.

If a range or cell reference contains non-numeric values such as text values, logical values or

empty cells, these values will be ignored.

Example:

	A	B	C	D	E	F	G	H	I	J	K
1	Course									MODE Result	
2	Math	78	85	90	72	85	63	97		85	
3	Biology	81	81	81	75	75	75	75		75	
4	Chemistry	80	81	82	83	84	85	86		#N/A

TechOnTheNet.com

Standard deviation: The Microsoft Excel STDEV function returns the standard deviation of a population based on a sample of numbers.

The STDEV function is a built-in function in Excel that is categorized as a *Statistical Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the STDEV function can be entered as part of a formula in a cell of a worksheet.

Syntax

STDEV(number1, [number2, ... number_n])

Parameters or Arguments

number1: A numeric value that can be a number, named range, array, or reference to a number.

number2, ... number_n: Optional. They are numeric values that can be numbers, named ranges, arrays, or references to numbers. There can be up to 30 values entered.

Returns

The STDEV function returns a numeric value.

Example

Coefficient of Variation: The Microsoft Excel COVAR function returns the covariance, the average of the products of deviations for two data sets.

The COVAR function is a built-in function in Excel that is categorized as a *Statistical Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the COVAR function can be entered as part of a formula in a cell of a worksheet.

Syntax

COVAR(array1, array2)

Parameters or Arguments

array1:A range or array of integer values.

array2:A range or array of integer values.

Returns

The COVAR function returns a numeric value.

Example

Based on the Excel spreadsheet above, you could enter the following formula:

=COVAR(A1:B2, D1:E2)

Result: 1.25

Trend: The TREND Function Calculates Y values based on a trendline for given X values. The trendline is calculated Using the least squares method based on two data series.

Formula Examples:

	A	B	C	D	E	F	G	H	I
1	TREND		=TREND(known_ys,known_xs,new_xs,const)						
2	Calculates Y values based on a trendline.								
3									
4	known_y's		known_x's	new_x's		const		Formula	Result
5	0		2	14				=TREND(\$B\$5:\$B\$10,\$C\$5:\$C\$10,E5)	6
6	1		4	16				=TREND(\$B\$5:\$B\$10,\$C\$5:\$C\$10,E6)	7
7	2		6	18				=TREND(\$B\$5:\$B\$10,\$C\$5:\$C\$10,E7)	8
8	3		8	20				=TREND(\$B\$5:\$B\$10,\$C\$5:\$C\$10,E8)	9
9	4		10	20		TRUE		=TREND(\$B\$5:\$B\$10,\$C\$5:\$C\$10,E9,F9)	9
10	5		12	20		FALSE		=TREND(\$B\$5:\$B\$10,\$C\$5:\$C\$10,E10,F10)	7.6923
11									
12									

Const is optional

Example

Formula

Result

1	=TREND(\$B\$5:\$B\$10,\$C\$5:\$C\$10,E5)	6
2	=TREND(\$B\$5:\$B\$10,\$C\$5:\$C\$10,E6)	7
3	=TREND(\$B\$5:\$B\$10,\$C\$5:\$C\$10,E7)	8
4	=TREND(\$B\$5:\$B\$10,\$C\$5:\$C\$10,E8)	9
5	=TREND(\$B\$5:\$B\$10,\$C\$5:\$C\$10,E9,F9)	9
6	=TREND(\$B\$5:\$B\$10,\$C\$5:\$C\$10,E10,F10)	7.69230769230769

Syntax and Arguments:

The Syntax for the TREND Formula is:

1 =TREND(known_ys,known_xs,new_xs,const)

Function Arguments (Inputs):

known_y's – An array of known Y values.

known_x's – An array of known X values.

new_x's – An array of new X values that you want TREND to return corresponding Y values for.

const – OPTIONAL. Logical value indicating whether to calculate B (the intercept in $y = mx + b$) using the least squares method (TRUE Or Ommitted) or to manually set $B = 0$ (FALSE).

Additional Notes

The TREND Function is an array function. To use array functions, enter the formula in the range of cells that you wish to calculate, select all the cells, press F2 to go into Cell Edit Mode, and press CTRL + SHIFT + ENTER.

How to use the TREND Function in Excel:

To use the AND Excel Worksheet Function, type the following into a cell:

=AND(

After entering it in the cell, notice how the AND formula inputs appear below the cell:

You will need to enter these inputs into the function. The function inputs are covered in more detail in the next section. However, if you ever need more help with the function, after typing “=TREND(” into a cell, without leaving the cell, use the shortcut **CTRL + A** (A for Arguments)

to open the “Insert Function Dialog Box” for detailed instructions:

Maximum: The Microsoft Excel MAX function returns the largest value from the numbers provided.

The MAX function is a built-in function in Excel that is categorized as a *Statistical Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the MAX function can be entered as part of a formula in a cell of a worksheet.

Syntax

MAX(number1, [number2, ... number_n])

Parameters or Arguments

number1: It can be a number, named range, array, or reference to a number.

number2, ... number_n

Optional: These are numeric values that can be numbers, named ranges, arrays, or references to numbers. There can be up to 30 values entered.

Returns:

The MAX function returns a numeric value.

Example

Based on the Excel spreadsheet above, the following MAX examples would return:

=MAX(A2, A3)

Result: 10.5

=MAX(A3, A5, 45)

Result: 45

=MAX(A2:A6)

Result: 200

=MAX(A2:A6, 325)

Result: 325

Minimum: The Microsoft Excel MIN function returns the smallest value from the numbers provided.

The MIN function is a built-in function in Excel that is categorized as a *Statistical Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the MIN function can be entered as part of a formula in a cell of a worksheet.

Syntax

MIN(number1, [number2, ... number_n])

Parameters or Arguments

number1: It can be a number, named range, array, or reference to a number.

number2, ... number_n

Optional. These are numeric values that can be numbers, named ranges, arrays, or references to numbers. There can be up to 30 values entered.

Returns:

The MIN function returns a numeric value.

Example

Based on the Excel spreadsheet above, the following MIN examples would return:

=MIN(A2, A3)

Result: 7.2

=MIN(A3, A5, -3)

Result: -3

=MIN(A2:A6)

Result: 5.4

=MIN(A2:A6, 3.6)

Result: 3.6

Large: The Microsoft Excel LARGE function returns the nth largest value from a set of values.

The LARGE function is a built-in function in Excel that is categorized as a *Statistical Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the LARGE function can be entered as part of a formula in a cell of a worksheet.

Syntax

LARGE(array, nth_position)

Parameters or Arguments

Array: A range or array from which you want to return the nth largest value.

nth_position: The position from the largest to return.

Returns:

The LARGE function returns a numeric value.

If *nth_position* is larger than the number of values in *array*, the LARGE function will return the #NUM! error.

If *array* is empty, the LARGE function will return the #NUM! error.

Example

Based on the Excel spreadsheet above, the following LARGE examples would return:

=LARGE(A1:A5, 1)

Result: 32

=LARGE(A1:A5, 2)

Result: 8

=LARGE(A1:A5, 3)

Result: 5.7

=LARGE(A1:A5, 4)

Result: 4

=LARGE(A1:A5, 5)

Result: -2.3

=LARGE({6, 23, 5, 2.3}, 2)

Result: 6

Small: The Microsoft Excel SMALL function returns the nth smallest value from a set of values.

The SMALL function is a built-in function in Excel that is categorized as a *Statistical Function*. It can be used as a worksheet function (WS) in Excel. As a worksheet function, the SMALL function can be entered as part of a formula in a cell of a worksheet.

Syntax

SMALL(array, nth_position)

Parameters or Arguments

Array: A range or array from which you want to return the nth smallest value.

nth_position: The position from the smallest to return.

Returns:

The SMALL function returns a numeric value.

If *nth_position* is larger than the number of values in *array*, the SMALL function will return the #NUM! error.

If *array* is empty, the SMALL function will return the #NUM! error.

Example:

	A	B	C	D	E	F	G
1	32		-2.3				
2	4						
3	5.7						
4	-2.3						
5	8						
6							

Based on the Excel spreadsheet above, the following SMALL examples would return:

=SMALL(A1:A5, 1)

Result: -2.3

=SMALL(A1:A5, 2)

Result: 4

=SMALL(A1:A5, 3)

Result: 5.7

=SMALL(A1:A5, 4)

Result: 8

=SMALL(A1:A5, 5)

Result: 32

=SMALL({6, 23, 5, 2.3}, 2)

Result: 5

Possible Questions – UNIT III

PART –A (1MARK)

(Online Examinations)

PART- B (2 MARK)

1. Mention the syntax for DATE ().
2. What is the use of Now ()?
3. What is the range of value returned by Year ()?
4. Write any four Mathematical functions.
5. Mention the use of Average function.
6. Write any four Statistical functions.
7. What is max() and min ()?
8. What is STDEV () and COVAR ()?

PART-C (6 MARK)

1. Explain in detail about Today ().
2. Discuss about Minute() and Seond().
3. Elaborate about Weekday().
4. Illustrate about Subtotal().
5. Discuss in detail about Median and Mode.
6. Narrate about Trend().
7. Explain about Large() and Small() with examples.

KARPAGAM ACADEMY OF HIGHER EDUCATION
(Deemed University Established Under Section 3 of UGC Act 1956)
Coimbatore - 641021.
(For the candidates admitted from 2018 onwards)
DEPARTMENT OF COMMERCE (CA)

SUBJECT: INTRODUCTION TO INFORMATION TECHNOLOGY
SEMESTER : I
SUBJECT CODE: 18CCU102

CLASS : I B.COM CA

UNIT- III- MS-Excel Functions

S.NO	QUESTIONS	OPTION 1	OPTION 2	OPTION 3	OPTION 4	ANSWERS
1	How do you display current date and time in MS Excel?	date ()	Today ()	now ()	time ()	Today ()
2	How do you wrap the text in a cell?	Format, cells, font	Format, cells, protection	format, cells, number	Format, cells, alignment	Format, cells, alignment
3	What does COUNTA () function do?	counts cells having alphabets	counts empty cells	counts cells having number	counts non-empty cells	counts non-empty cells
4	Which function is used to calculate depreciation, rates of return, future values and loan payment amounts?	Logical	Math & Trigonometry	Statistical	Financial	Financial
5	Which is an example of a function?	add(A1:A2)	0	=SUM(A1:A2)	A1+A2	=SUM(A1:A2)
6	What is the symbol for multiplying?	>	/	!	*	*
7	What will be the formula in D10 on copying the formula '=A\$5*5' from cell B4?	=A\$5*5	0	0	0	0
8	Which is the correct expression to find the average of the range named “units”?	`AVG(units)	average(“units”)	units(average)	average(units)	average(units)
9	What is entered by the function =today()	The date value for the day according to system clock	The time value according to system clock	Today’s date as Text format	Today’s day	The date value for the day according to system clock
10	Which function removes the decimal portion of a value?	CUTOFF	ROUNDUP	TRUNC	TRIM	TRUNC
11	Which function tallies all cells in a range whether the cell has a value or a label?	COUNT	SUMA	COUNTA	TOTAL	COUNTA
12	Accounting calculation can be applied from	from Format >> Cells	from Format >> Auto format	from Table >> Auto format	All of above	from Format >> Auto format
13	You can use the formula palette to	format cells containing numbers	create and edit formula containing functions	enter assumptions data	copy a range of cells	create and edit formula containing functions
14	What will be the output if you format the cell containing 5436.8 as '#,##0.00'?	5,430.00	5,436.80	5,436.8	6.8	5,436.80
15	Which setting you must modify to print a worksheet using letterhead?	Paper	Margin	Layout	Orientation	Margin
16	In Excel, a Data Series is defined as what?	A type of chart.	A cell reference.	A collection of related data	A division of results	A collection of related data
17	A _____ is a grid with labelled columns and rows.	Dialog box	Worksheet	Clipboard	Toolbar	Worksheet
18	Which function is used to calculate depreciation, rates of return, future values and loan payment amounts?	Logical	Math & Trigonometry	Statistical	Financial	Financial
19	In help menu of Excel, which of the following tabs are found?	Contents tab	Answer Wizard tab	Index tab	all of the above.	all of the above.
20	B7:B9 indicates	Cells B7 and cell B9 only	Cells B7 through B9	Cell B8 only	None of the above	Cells B7 through B9
21	The Cancel and Enter buttons appear in the	Title bar	Formula bar	Menu bar	Sheet tabs	Formula bar
22	Which of the following series type is not valid for Fill Series dialog box?	Linear	Growth	Autofill	Time	Time
23	The box on the chart that contains the name of each individual record is called the	cell	. title	. axis	legend	. legend
24	If you want all of the white cats grouped together in the database, you need to sort by	Colour, then Gender	Pet Type, then Colour	Pet Type, then Gender	Colour, then Pet Name	Pet Type, then Colour
25	Edit >> Delete command	Deletes the content of a cell	Deletes Formats of cell	Deletes the comment of cell	Deletes selected cells	Deletes selected cells
26	Where a row and a column meet, what do you call that?	A cell	A block	A box	None of the above	A cell
27	How do you tell one cell from another?	By numbers	By letters	By its address	by colour	By its address
28	Which is an example of a function?	A1:A2	A1+A2	A1=A2	.=SUM(A1:A2)	.=SUM(A1:A2)
29	Give me an example of a cell address.	11 25	911	41A	A21	A21
30	What tool is capable of calculating monthly rainfall amounts and creating graphs based on that data?	Clip art	Graphics	Spreadsheet	Word processor	Spreadsheet
31	To delete cell entry, select	edit, delete	edit, clear	view, normal	none of the above	edit, clear
32	How do you magnify your worksheet window?	View, Zoom	Format, Sheet	Tools, Options	Enlarge the font size	View, Zoom
33	What does the AVERAGE function calculate for a range of cells?	Mean	Sum	Median	Mode	Mean
34	What category in the Format Cells dialog box is used to define a unique format for a date?	Custom	Date	Special	Text	Custom
35	What symbols might be shown by an icon set conditional formatting rule?	Shaded bars	Gradient filled cells	Various arrows	I-beam pointers	Various arrows

36	What appears in the title bar when worksheets are grouped?	Grouped	Band	Set	Group	Group
37	Which function might display different results on three different computers?	TODAY()	SUM	SUMIF	TRUNC	TODAY()
38	You can check the conditions against _____ when applying conditional formatting	Cell value	Formula	Cell value and formula	None of above	Cell value and formula
39	A _____ is a grid with labelled columns and rows.	Dialog box	Worksheet	Clipboard	Toolbar	Worksheet
40	B7:B9 indicates	Cells B7 and cell B9 only	Cells B7 through B9	Cell B8 only	None of the above	Cells B7 through B9
41	The format that organizes information in labeled columns and numbered rows is _____ format.	tabular	graphical	matrix	container	tabular
42	Excel uses the _____ presentation of information via charts and graphs.	container	sectioned	graphical	tabular	Macro Recorder
43	The keyboard shortcut for the Comma format is _____.	Ctrl + Shift + #	Ctrl + Shift + @	Ctrl + Shift + C	Ctrl + Shift + !	Ctrl + Shift + !
44	There are how many different types of cell references?	Two	Three	Four	Five	Three
45	An absolute cell reference is denoted by a(n) _____.	dollar sign (\$)	asterisk (*)	number sign (#)	at sign (@)	dollar sign (\$)
46	When cell B2 containing the formula =A4*B6 is copied to cell C1, the formula in cell C1 is _____.	.=A4*C5	.=A4*B6	. =B3*C5	. =B3*C6	. =B3*C5
47	When cell A4 containing the formula =\$B\$5/\$C\$6 is copied to cell F6, the formula in cell F6 is	. =G7/H8	. =\$G\$7/\$H\$8	. =B5/C6	. =\$B\$5/\$C\$6	. =\$B\$5/\$C\$6
48	Instead of typing the \$ symbol in a cell reference, you can use the _____ keyboard shortcut.	F4	F2	F7	F11	F4
49	Names for ranges CANNOT begin with a(n) _____.	letter	number	underscore (_)	backslash (\)	number
50	Which of the following is an alternative to using a space when naming a range?	Use a hyphen	Use an equal sign	Capitalize the first letter of each word	Use an underscore	Use an underscore
51	To modify a named range, you select its name in the Name Box, then click Name Manager in the _____ tab.	Defined Names group on the Home	Edit Names group on the Home	Defined Names group on the Formulas	Edit Names group on the Formulas	:
52	If a chart is selected, a(n) _____ border represents the data series.	orange	purple	blue	green	blue
53	An individual data value in a data series is a data _____.	mark	bar	point	series	point
54	If a chart is inserted on the same worksheet where the data lives, it is _____ on the worksheet.	a chart sheet	integrated	embedded	wrapped	embedded
55	The _____ tool is a contextual tool that appears when you select data in a worksheet	Quick Analysis	Sparklines	Quick Chart	Insert Charts	Quick Analysis
56	Which of the following functions returns the number in the middle of a set of numbers?	COUNT	MEAN	MEDIAN	COUNTA	MEDIAN
57	A chart element can be easily removed by selecting the element and pressing _____.	Esc	Ctrl + Del	Del	Alt + Del	Del
58	A _____ is a line that shows the direction of the data.	sparkline	trendline	data bar	legend	trendline
59	If you want to find the time between two dates, you would use the _____ function.	TIME	DATE	DATEDIFF	WEEKNUM	DATEDIFF
60	What category of functions is used in this formula? =PMT(C10/12,C8,C9,1)?	Logical	Financial	Payment	Statistical	Financial

UNIT-IV

SYLLABUS

MS Power point: Introduction to presentation – Opening new presentation, Different presentation templates, Setting backgrounds, Selecting presentation layouts. **Creating a presentation** – Setting Presentation style, Adding text to the Presentation. **Formatting a Presentation** – Adding style, Colour, gradient fills, Adding Header & Footer, Slide Background, Slide layout, Adding Graphics to the presentation – Inserting pictures, movies, tables into presentation, Drawing pictures using Draw. **Adding effects to the Presentation** – Setting Animation & transition effect, Printing Handouts, Generating Standalone Presentation viewer.

Introduction to Microsoft PowerPoint

Getting started

- a) Select the **Start** button towards the bottom left of the screen.

- b) Select each of the following: **Programs; Microsoft Office® > Microsoft Powerpoint**
- c) Within a few moments, *Microsoft PowerPoint®* will open.

Starting a new presentation

- a) When you first open *PowerPoint®*, a new presentation will automatically appear.

- b) If at any time you wish to start a new presentation, select the **Home tab** and click **New Slide**

Opening a recent or existing presentation

Click the **Microsoft Office Button**

Then select the open icon to select the powerpoint presentation you wish to work on or if it's a recently accessed powerpoint presentation, select the presentation from the **recent documents** listed on the right hand side of the dialog box as seen below

Add a new slide

- d) On the **Home tab**, in the **Slides** group, click **New Slide**.

Different presentation templates:

When you create a presentation and then save it as a PowerPoint template (.potx) file, you can share it with your colleagues and reuse it again. To create a template, you'll need to modify a slide master and a set of slide layouts.

There are thousands of free PowerPoint templates you can search for online when you open PowerPoint

Creating a new template using masters

Like Design Templates, Masters allow you to make design decisions that will then affect each slide or page in the presentation. There are masters for Slides, Title Slide, Handouts and Notes.

Each Design Template has its own Slide Master that can be altered. If you create slides from scratch, a consistent style can be added to the presentation by formatting the Slide Master.

- Select **View** menu < **Master** < **Slide Master** (or another master from the list)
- Open a blank presentation, and then on the **View** tab, in the **Master Views** group, choose **Slide Master**. .
- It is a good idea to set up the master **before** building any slides. When you create the master first, all slides you add to the presentation will be based on that master. If, however, you build slides before establishing the master, some items on the slides may not change to conform. You can override **some** of the master specifications on individual slides by using the background and text formatting features, but others, such as master footers and logos can only be modified on the master view.
- If you wish to keep the design you created using masters for use in future presentations, you must save it as a template.
 - Create or open the master slide of the design you want to save.
 - Select **File** menu < **Save As...**
 - **Do NOT** change the default 'Save in' location.
 - On the Save as type menu, select '**Design Template**'.
 - Give a name to your new design and click 'Save'. The next time you select **Format** < **Apply Design Template** the design you created will appear in the list of options. Select it and click 'OK' to apply it to the presentation.

Sample Templates:

Setting backgrounds:

As PowerPoint is a design-based program, backgrounds are effective ways of improving the aesthetics and readability of the slides. The **Themes** in PowerPoint help select the backgrounds by default, so every time you change the theme, the default background is set automatically. Theme includes more than just backgrounds, so you can retain other aspects of the theme while changing the default background.

Given below are the steps to apply backgrounds in PowerPoint.

Step 1 – In the **Design** ribbon, under the **Background** group, click the **Background Styles** command.

Step 2 – Select one of the background styles that suits your requirements.

Step 3 – To edit the background for a specific slide, right-click on the desired background slide and select "**Apply to Selected Slides**".

Step 4 – Selected slide(s) now have the new background.

The graphics in the slide background can distract you from the actual content, in such cases you can hide the graphics and retain a plain background till you finish working on the content. To do this, select the slide and check the "**Hide Background Graphics**" checkbox.

Creating a presentation:

PowerPoint offers a host of tools that will aid you in creating a presentation. These tools are organized logically into various ribbons in PowerPoint. The table below describes the various commands you can access from the different menus.

KARPAGAM ACADEMY OF HIGHER EDUCATION

CLASS: I B.Com(CA)

COURSE NAME: Introduction to Information Technology

COURSE CODE: 18CCU102

UNIT: IV(MS Power point)

BATCH -2018-2021

Menu Category

Ribbon Commands

Home	Clipboard functions, manipulating slides, fonts, paragraph settings, drawing objects and editing functions.
Insert	Insert tables, pictures, images, shapes, charts, special texts, multimedia and symbols.
Design	Slide setup, slide orientation, presentation themes and background.
Transitions	Commands related to slide transitions.
Animations	Commands related to animation within the individual slides.
Slide Show	Commands related to slideshow set up and previews.
Review	Proofing content, language selection, comments and comparing presentations.

View	Commands related to presentation views, Master slides, color settings and window arrangements.
------	--

Besides these depending on the objects selected in the slide, there are other menu tabs that get enabled.

Setting Presentation style:

Everyone on the internet has an opinion on how to give the “perfect” presentation. There are six types of presentation styles:

1. Visual Style
2. Freeform Style
3. Instructor Style
4. Coach Style
5. Storytelling Style
6. Connector Style

1. Visual Style

What it is: If you’re a firm believer slides simply exist to complement your talking points, this style is for you. With this speaking style, you might need to work a little harder to get your audience engaged, but the dividends can be huge for strong public speakers, visionaries, and storytellers.

When to use it: This style is helpful when speaking to a large audience with broad interests. It’s also great for when you need to throw together slides quickly.

2. Freeform Style

What it is: This impromptu style of presenting doesn’t require slides. Instead, the speaker relies on strong stories to illustrate each point. This style works best for those who have a short presentation time and are extremely familiar with their talking points.

When to use it: Elevator pitches, networking events, and impromptu meetings are all scenarios in which to use a freeform style of speaking. You’ll appear less rehearsed and more conversational than if you were to pause in the middle of a happy hour to pull up your presentation on a tablet.

3. Instructor Style

What it is: This presentation style allows you to deliver complex messages using figures of speech, metaphors, and lots of content -- just like your teachers and professors of old. Your decks should be built in logical order to aid your presentation, and you should use high-impact visuals to support your ideas and keep the audience engaged.

When to use it: If you're not a comfortable presenter or are unfamiliar with your subject matter (i.e., your product was recently updated and you're not familiar with the finer points), try instructor-style presenting.

4. Coach Style

What it is: Energetic and charismatic speakers gravitate towards this style of presenting. It allows them to connect and engage with their audience using role play and listener interaction.

When to use it: Use this presentation style when you're speaking at a conference or presenting to an audience who needs to be put at ease. For example, this style would work well if you were speaking to a group of executives who need to be sold on the idea of what your company does rather than the details of how you do it.

5. Storytelling Style

What it is: In this style, the speaker relies on anecdotes and examples to connect with their audience. Stories bring your learning points to life, and the TED's Commandments never let you down: Let your emotions out and tell your story in an honest way.

When to use it: Avoid this style if you're in the discovery phase of the sales process. You want to keep the conversation about your prospect instead of circling every point or question back to you or a similar client. This style is great for conference speaking, networking events, and sales presentations where you have adequate time to tell your stories without taking minutes away from questions.

6. Connector Style

What it is: In this style, presenters connect with their audience by showing how they're similar to their listeners. Connectors usually enjoy freeform Q&A and use gestures when they speak. They also highly encourage audience reaction and feedback to what they're saying.

When to use it: Use this style of presenting early in the sales process as you're learning about your prospect's pain points, challenges, and goals. This type of speaking sets your listener at ease, elicits feedback on how you're doing in real time, and is more of a dialogue than a one-sided presentation

Add Text to the presentation:

This tutorial shows you how to add text to slides in PowerPoint. You can add text to slides in PowerPoint using placeholders, text boxes, or shapes. When creating presentations, you often enter text into the text and title placeholders that are part of the slide layout. However, you can also add additional text to text boxes or shapes to supplement the text placeholders in the slide.

Placeholders, text boxes, and shapes that contain text use two distinct modes. First, they are shapes, so they can be formatted, edited, and moved as shape objects. Second, they must also allow you to edit, add, remove, and format the text that they contain. PowerPoint uses two different modes for text-containing objects. This lets you apply changes to the object itself or to selected text within the object.

In PowerPoint, a text-containing object's mode is shown by its border. A border composed of dashes means that the object is in "text edit" mode. In this mode, you may select and change text inside the object.

A solid line border indicates that the shape is in "object" mode. The object itself and all text within it is selected and changeable in this mode. It is important to know which mode the object is in before performing a task or applying formatting.

You can click directly on the border of a shape to place it into "object" mode. You can hover over the object's text and then click into it to switch the object to "text editing" mode. Doing this also places the insertion point into the text. You can then click and drag over text to select it and then edit or format the selected text.

After applying a slide layout, you can click into the text placeholders in the slide and enter text. The advantage to adding text to slide placeholders is that the text then appears in the presentation's "Outline" view. If using "Outline" view is important to you, ensure you enter the

text to appear in the outline into slide placeholders. This is a subtle but important difference between slide placeholders and other text-containing shapes in your slide.

If you don't need the text to appear in "Outline" view, then you can insert it into a text box. You could also add it to a shape. First, though, you need to learn how to insert text boxes and shapes into your slide.

To insert a text box, click the "Insert" tab in the Ribbon. Then click the "Text Box" button in the "Text" group. Finally, click and drag over the area in the slide where you want to insert the text box. It will insert in "text edit" mode, so you can immediately type your text. You **must** immediately type some text into the text box. If you don't, and then click away from the text box, PowerPoint removes it from the slide.

To add text to a shape, click the shape to select it and then type your text. To insert a shape, click the "Shapes" button in the "Illustrations" group on the "Insert" tab in the Ribbon. Then click the shape to add from the drop-down menu of choices. Finally, click and drag over the area in your slide where you want to place the shape. It inserts itself when you release your mouse. It appears selected in the slide when it is inserted. So, at that point, simply type the text you want to add to the selected shape.

Add Text to Slides in PowerPoint:

1. In PowerPoint, a text-containing object's mode is shown by its border.
2. A border composed of dashes means it is in "text edit" mode.
3. A solid line border means it is in "object" mode.
4. **To place it into "object" mode**, click directly on the border of the object.
5. **To switch the object to "text edit" mode**, click into the text within the object.
6. After applying a slide layout, you can click into the text and title placeholders to add text to slides in PowerPoint.
7. The text added to slide placeholders appears in the "Outline" view of your presentation.
8. **To insert a text box**, click the "Insert" tab in the Ribbon.
9. Then click the "Text Box" button in the "Text" button group.
10. Then click and drag over the area in the slide where you want to insert the text box.
11. Finally, release your mouse button to insert the text box.
12. Immediately type some text. You **must** immediately enter text or the text box will be deleted when you click away from it.
13. **To insert a shape**, click the "Shapes" button in the "Illustrations" group on the "Insert" tab in the Ribbon.
14. Then click the shape to add from the drop-down menu of choices.
15. Then click and drag over the area in your slide where you want to place the shape.
16. Finally, release your mouse button to insert the shape.
17. Type the text to add to the selected shape.

Selecting presentation layouts:

In the recent years, presentations are being used for more than just as a high end replacement for transparencies and projectors. With its unique features, PowerPoint is becoming quite versatile in the kind of information it can depict and very flexible in its usage. The slide orientations are invaluable part of this improved list of PowerPoint features. Like most other applications PowerPoint supports two orientations: **landscape** and **portrait**.

The **Landscape** layout is the default PowerPoint layout and it is probably the more commonly used one. In the landscape layout, the longer edge is horizontal so the slides align better with the screens and projectors.

The **Portrait** layout is where the shorter edge is horizontal. This is sometimes better for print depending on the kind of content you want to present.

Slide orientations in PowerPoint can be changed from the **Design** ribbon using the **Slide Orientation** command.

. Formatting a Presentation

Adding style:

One of the most powerful tools in Microsoft Office is the application of formatting feature. This feature basically lets you define the right format once and apply the same to a series of objects in the rest of the presentation or any other file. While working with large presentations or just working on slides for a long time, if you ever need to make a change in the style and want it applied across multiple content this is the tool to use.

The following are the steps to apply formatting to your presentation –

Step 1 – Select the content you want to copy the formatting from.

Step 2 – Go to the **Clipboard** group under the **Home** ribbon.

Step 3 – Click on the Format Painter icon.

Step 4 – Select the content you want to format.

Here are some key aspects about the Format Painter –

- If you click on the Format Painter icon just once, the formatting will be copied just once.
- If you click on the Format Painter icon twice quickly, you can copy the formatting multiple times.
- If you want to copy just the text formatting and not the paragraph features, ensure that you select just the sample text and not the entire paragraph.
- If you want to copy paragraph and font formatting, you must select the entire paragraph.

Colour:

Apply a solid color to the slide background

1. Click the slide that you want to add a background color to.

To select multiple slides, click a slide, and then press and hold CTRL while you click the other slides.

2. On the **Design** tab, in the **Background** group, click **Background Styles**, and then click **Format Background**.

3. Click **Fill**, and then click **Solid Fill**.

Alternatively, if you want to use a colored gradient or texture fill, click either **Gradient fill** or **Picture or texture fill** and choose the options you want.

4. Click **Color** , and then click the color that you want.

To change to a color that is not in the theme colors, click **More Colors**, and then either click the color that you want on the **Standard** tab, or mix your own color on the **Custom** tab. Custom colors and colors on the **Standard** tab are not updated if you later change the document theme.

5. To change the background transparency, move the **Transparency** slider.

You can vary the percentage of transparency from 0% (fully opaque, the default setting) to 100% (fully transparent).

6. Do one of the following:
 - To apply the color to the slides that you selected, click **Close**.
 - To apply the color to all of the slides in your presentation, click **Apply to All**.

Gradient Fills:

1. Right-click the slide thumbnail of a slide you want to add a gradient background color to and then select **Format Background**.

The **Format Background** dialog box opens.

- ☐ On the **Fill** tab, select **Gradient fill**.
- ☐ To use preset PowerPoint gradients, do step 4, then continue with step 6. To customize color gradients yourself, do step 5, then continue with step 6.
- ☐ To use the preset color, type, and direction gradients, click **Preset colors**, and then select an option.

Select **More Colors** for more standard color choices, or to create a custom color.

- To adjust gradient color coverage, click and drag the stops to the right or left. Or you can set incremental percentages by moving the **Position** up and down to a percentage that you want.
- Do the same thing for any other gradient stops. (There are 3 stops shown in the example diagram above. Use the **Add** or **Remove** button to change the number of gradient stops).
- ☐ To change the background transparency, move the **Transparency** slider.

You can vary the percentage of transparency from 0% (fully opaque, the default setting) to 100% (fully transparent).

On the **Format** tab, click **Shape Fill**, click **Gradient**, and select the one you want.

Adding Headers and Footers:

1. The first step is to open the presentation and then click on the Insert tab.
2. Next, in the ribbon, go to the text grouping of commands and click on Headers & Footers.

3. The Header and Footer dialogue box opens with several options.
4. You'll make your selections and click on Apply to apply to just this slide or Apply to All to apply to all slides.

But notice that there is not an option for the header because the header can't be shown on slides. Only the footer can be displayed.

But let's stop a moment and review your options in the dialogue box. The first one is an option to add date and time information. Here, you can choose to have date and time update each time you open your PowerPoint file, or you can fix it to a specific time and date. Clicking on the pick-list or down-arrow for the date selection box will give you different format choices for time and date information.

The second option is to add slide numbers. Sometimes, this helps to keep track of where you are in the presentation. The third option is to add footer information. Here, you might add a company or presenter information. Although PowerPoint is normally used to display on screen in front of an audience, it's good to be able to display company and presenter information. This helps the audience to not forget who is presenting! And then the final option is to omit this information from the title slide, which is usually a good practice.

A preview box in the upper, right-hand corner of the dialogue box will show you where each type of content will be displayed on your slide. Your choice of slide theme will determine where the header and footer information will eventually end up. However, once placed into the slides, they can be moved around just like any other text box in your presentation. Let's move on to adding headers and footers to the handouts and notes pages.

Slide Background:

When you're working with PowerPoint slides or an overall theme, there's a good chance you will want to change the background from the standard white to something more customized.

Backgrounds come in a few styles: solid, gradient, picture or texture, and pattern.

To change the background of a slide or slides, follow the instructions in the video above, or:

1. Go to the **DESIGN** tab.
 2. Click the **Format Background** button.
 3. In the Format Background Pane that appears, select the type of fill for your slide background. It will immediately apply to the slide (no need to click an option like “apply.”)
 4. Depending on your choice, modify the additional options. For example, if you choose a gradient fill, you can modify the type, direction, angle, gradient stops, transparency, and so on.
 5. Select **Reset Background** if you’d like to remove the background formatting. Select **Apply to All** if you want to apply your choices to all slides in the presentation.
- Slide layout:

Apply a slide layout in Normal View

Pick a pre-designed layout that matches the arrangement of text and other object placeholders that you plan to put on your slide.

If you don't want a layout that puts any on the slide, you can choose the **Blank** layout in step 3.

1. On the **View** tab, click **Normal**.
2. In Normal View, in the thumbnail pane on the left, click the slide that you want to apply a layout to.
3. On the **Home** tab, click **Layout**, and then select the layout that you want.

Change a slide layout in Slide Master View

If you are unable to find a slide layout that works with the text and other objects that you plan to put on your slides, change a layout in Slide Master View.

1. On the **View** tab, click **Slide Master**.
2. In Slide Master View, in the thumbnail pane on the left, click a slide layout that you want to change.

3. On the **Slide Master** tab, to change the layout, do one or more of the following:
- To add a placeholder, click **Insert Placeholder**, and then pick a type of placeholder from the list.
 - To rearrange a placeholder, click the edge of the placeholder until you see a four-headed arrow, and then drag the placeholder to the new location on the slide.
 - To delete a placeholder, select the placeholder, and then press **Delete** on your keyboard.
 - To add a new layout, click **Insert Layout**.
 - To rename a layout, in the thumbnail pane on the left, right-click the layout that you want to rename, click **Rename Layout**, type the new name of the layout and then click **Rename**.

Important: If you change a layout that you've used in your presentation, go into Normal View and reapply the new layout to those slides if you want them to get your changes. For example, if you change the Demo slide layout, the slides in your presentation using the Demo layout keep the original appearance if you don't apply your revised layout to each one.

4. On the **Slide Master** tab, click **Close Master View**.

In the next steps, you finish the process by re-applying the changes to the slides in your presentation that use the layout you just changed.

5. In Normal View, in the thumbnail pane, click the slide that you want to reapply the updated layout to.

(To select multiple slides, press and hold the Ctrl key, and then click each slide.)

6. On the **Home** tab, in the **Slides** group, click **Layout**, and then select the layout that you updated in Slide Master View.

Adding Graphics to the presentation:

The Format Background utility in PowerPoint allows you to select an image from your computer or online to use as the background for your slide. You can set this background to multiple slides at once, or apply it to your entire presentation. You can also add effects to the background image to give it a bit of flair. If you aren't able to change the background elements, you may have to edit the slide master.

When it comes to working with graphics in PowerPoint, presenters might be surprised by the number of tools at their disposal.

If a picture is worth a thousand words, it makes sense that images would be an integral part of great PowerPoint presentations, right? After all, the best slides are meant to compliment and support your narration. And while choosing the best fonts and adding cool animations can help, the right images can often make the biggest difference of all.

Of course, there are certain best practices to follow when choosing graphics for PowerPoint presentations. But that doesn't mean you can't still get creative with your slides.

Here are four simple ways that anyone can create better, more professional-looking graphics in PowerPoint.

#1. Create custom shapes. PowerPoint includes a lot of set graphics and images to include with your slides, coming in a variety of shapes and sizes. But with a little creativity, anyone can utilize those figures to create any custom shapes they desire. Buildings, animals, vehicles (see below) – the possibilities are literally endless. Check out this video for a short tutorial on creating custom shapes in PowerPoint.

#2. Get familiar with Picture Tools. Most people know that the PowerPoint Picture Tools tab allows you to do simple things like add borders and shadows to images. But as Brainshark's Paula Crerar explains, that's really just the tip of the iceberg. This two-minute presentation explains how to use a few more advanced (yet simple) Picture Tools options, such as focusing the resolution of an image or editing a graphics background.

#3. Highlight parts of an image with Artistic Effects. Say you have a graphic with multiple objects, but you really only want to focus on one of them. Using the Artistic Effects option in PowerPoint, you can easily zero in on a single area while making everything else fade to the background (see below). The area of focus can be a person, product – anything. This short video demonstrates how the Artistic Effects feature works.

#4. Use silhouettes instead of stock images. While including pictures of actual people in your slides can be great, in some cases it's preferable to simply "represent" a person instead. In

PowerPoint, you can do this by transforming standard images and photos into silhouette outlines to use as characters in your presentations.

Inserting pictures into presentation:

You can add single or multiple images onto a slide, the slide master, or to the background.

Insert a picture from your computer on your slide

1. Click where you want to insert the picture on the slide.
2. On the **Insert** tab, in the **Images** group, click **Pictures**.

3. In the dialog box that opens, browse to the picture that you want to insert, click that picture, and then click **Insert**.

Tip: If you want to insert multiple pictures at the same time, press and hold the Ctrl key while you select all the pictures you want to insert.

Insert a picture from the web on your slide

1. Click where you want to insert the picture on the slide.
2. On the **Insert** tab, in the **Images** group, click **Online Pictures**.

3. (PowerPoint 2016) Ensure **Bing** is showing on the left in the drop-down list of sources to search. In the box, type what you are searching for, and press Enter.

(PowerPoint 2013) In the **Bing Image Search** box, type what you are searching for, and press Enter.

Use the **Size, Type, Color, Layout**, and licensing filters to adjust the results according to your preferences.

4. Click the picture you want to insert, and click **Insert**.

Tip: If you want to insert multiple pictures at the same time, press and hold the Ctrl key while you select all the pictures you want to insert.

Tip: After you insert a picture, you can change its size and position. To do so, right-click the picture, and click **Format Picture**. You can then use the **Format Picture** tools that are on the right of your slide.

Inserting movies into presentation

In PowerPoint use the **file/insert - Movies and Sounds - Movie from a File** method. "Movies" are desktop video files with formats such as AVI, QuickTime, Windows Media Video, and MPEG, with file extensions such as .avi, .mov, .qt, .wmv, .mpg, and .mpeg. Whether your movie file plays in PowerPoint or not depends on your version of Microsoft Windows, your version of Windows Media Player, and the video formats installed on your computer. If your movie clip will not insert or doesn't play, a fix is to convert it to a file format that PowerPoint supports. Step by Step:

1. Any movie you "insert" into PowerPoint 2010 is really only linked to your presentation; it plays from a location outside the PowerPoint .ppt file and is not embedded into it. When you insert the file, PowerPoint creates a link to the movie file's current location. If you later move the movie file to a different location, PowerPoint will not know where to find it when you want the file to play. So how can you make sure that PowerPoint will find your movie file to play it?

Before you insert the movie file, create a folder and place your PowerPoint Presentation into it. Then place the movie into the same folder as your PowerPoint presentation. Then insert it into a PowerPoint slide. PowerPoint will create a link to it, and it will find the file as long as you keep it in the same folder, even if you move or copy the folder to another computer.

2. On a Windows computer, open your PowerPoint file and navigate to the slide where you want the movie to play.
3. From the File menu, select **Insert**, then **Video** then **Video from File**. When prompted, choose whether PowerPoint will play the movie automatically or when you click on the image of the Movie.

Inserting tables into presentation:

One of the most powerful data representation techniques is the use of tables. Table allows information to be segregated making it easy to read. PowerPoint has features that let you add tables in slides and also format them to enhance their visual effects. What's more, these tables are also compatible with Microsoft Excel, so you can basically take a spreadsheet or a section of a spreadsheet and paste it into a slide as a table.

The following steps will help you add a table in PowerPoint.

Step 1 – Go to the **Tables** group under the **Insert** ribbon.

Step 2 – Click on the dropdown and select your table dimension from the matrix.

Step 3 – If you require more than 10 columns or 8 rows click on "**Insert Table**" to open the **Insert Table** dialog where you can specify the column and row count.

PowerPoint table is a simple table that does not support the mathematical features of an Excel spreadsheet. If you want to carry out some calculations, you can insert an **Excel spreadsheet** instead of a regular table.

This will insert the spreadsheet in the slide and as long as the spreadsheet is selected, the ribbon at the top will be changed to an Excel ribbon instead of a PowerPoint one.

The PowerPoint table formatting features have been grouped under two ribbons: **Design** and **Format**. The sections below discuss the features under each ribbon. To access these ribbons, you must select the table first.

Drawing pictures using Draw:

If you are unable to find images or clip art for your presentation, PowerPoint provides the tools to draw your own. You can create simple shapes and objects with the built in drawing tools, choose from the collection of ready-made shapes, combine simple shapes to create more complex ones, draw an object from scratch, and even add text to your drawings. You can also add formatting effects to your shapes, including resizing, rotating, 3D effects such as shadows and beveling, and changing the color of all or part of the shape.

Drawing Preset Shapes

In the *Insert* command tab, the *Shapes* group contains several categories of shapes, including lines, basic shapes, block arrows, flowchart elements, stars and banners, and callouts.

- To see PowerPoint's built-in shapes, go to the **Insert tab** and under the **Illustrations group** click on the **Shapes button** to see the list.
- Click on your desired shape.
- On the slide, click and drag your mouse to create your shape.
- Once your shape is in place you can move it around, use the handles to change the size and rotation, and edit it as you would any other object.

Drawing Custom Shapes

To draw your own shapes you can use the freehand drawing tools, **Curve**, **Freeform** and **Scribble**. **Curve** lets you draw shapes with curves; **Freeform** lets you draw shapes with both curves and angles; and **Scribble** lets you draw shapes and lines freehand. You can also combine these tools with other preset shapes (see [Editing Images](#) for instructions on grouping objects).

- From the **Insert tab** in the **Illustrations group** click on the **Shapes button**.
- Under **Lines**, the last three (3) options are **Curve**, **Freeform** and **Scribble**.
Note: You can use the other options to create shapes as well, however these three are the only ones we will cover in this tutorial.

To create a **Curve**

- Click and release your mouse button on the slide to begin the shape.
- Drag your mouse to draw. Click to anchor a point around which your curve will form.
- To finish your drawing, either **double-click** to leave it as a line, or **link the curve by clicking the starting point** to create a solid shape.

To create a **Freeform** shape

- Click and release your mouse button to begin the shape.
- To **anchor the endpoints of straight lines**, click and release.
- To **draw curves**, click and drag.

Hint: The Freeform tool allows you to draw both straight and curved lines in the same picture.

- To finish your drawing, either **double-click** to leave it as a line, or **click the starting point** to create a solid shape.

To create a **Scribble**

- Click and drag your mouse to draw a Scribble.
- **Double-click** when you are finished drawing or **click the starting point** to create a solid shape.

You can always edit the anchor points on your shape after you have created it (see below), so don't worry about getting it perfect the first time!

Adding Text to a Shape

Rather than going through the hassle of layering text boxes on top of shapes, you can add text directly to a shape so that it moves, rotates, shrinks and expands when you format the object.

This text is a part of the shape!

- First click on the shape to select it.
- Under the **Drawing Tools - Format** tab in the **Shapes** group click on **Text Box**.
- Your mouse cursor will change into a text cursor. **Click inside the shape** and start typing. Your text will automatically be aligned to the center of the image.

Whenever you move your mouse over the text area of the shape your pointer will change to the text cursor to allow you to select and edit your text. Highlight the text and use the options on the Home tab to edit it, or use the WordArt features under the Drawing Tools tab to add 3D effects

Editing Custom Shapes

Drawings in PowerPoint can be formatted just like any other object - you can move them, use the handles to resize and rotate (see the instructions for resizing and formatting text boxes).

Anchors

With custom shapes you have the additional ability to edit anchor points, the key to making sure your drawing is just the way you want.

- **Double-click** on your drawing to activate the **Drawing Tools - Format** tab.
- In the **Insert Shape** group, click on the **Edit Shape** button and choose **Edit Points**.
- Black points will appear around your shape. You can either **click** on a point and **drag** it to stretch or shrink that area of your shape, or you can click on a point and use the **line and handles** that appear to alter the curve (as in the bottom left of the shape below).

- *Note: More points will appear for a freehand or scribble shape than for a curve as these have more rough points. To **create a new point** click and drag anywhere on the edge of your shape.*

Shape Styles

You can also change the color and outline of a shape, or add 3D effects. You can reach these options either by **double-clicking** the shape and using the **Drawing Tools** tab or by using the more condensed **Drawing group** in the **Home** tab.

The **Shape Styles** group on the Drawing Tools tab provides the tools to customize your shape. Choose a preset style from the **Style Gallery**, or create your own

by using the **Shape Fill** and **Shape Outline** menus to pick the color of your shape and border and the **Shape Effects** menu to add shadow, bevel, and other 3D effects

The **Drawing group** on the Home tab has all the options of the Shape Styles group as well as the **Shape gallery** and the **Arrange** menu. To access the **Shape Style gallery** click on the **Quick Styles** button.

Adding effects to the Presentation :

Setting Animation & transition effect

You can add slide transition animation in PowerPoint to your presentation slides. Slide transition animation in PowerPoint is the animation that occurs when you advance from slide to slide within the presentation. You have many options for controlling the effects of the slide transition animation in PowerPoint. For example, you can often set the speed and direction of many transition animations. You can also add sound effects to complement the slide transition animation in PowerPoint, if desired.

You can add slide transition animation in PowerPoint to a single slide or to all slides at once. To do this, select the slide or slides to which you want to apply slide transition animation from the “Slides” pane. This pane appears at the left side of the “Normal” view. Then click the “Transitions” tab in the Ribbon. Then use the buttons and options in the “Transition to This Slide” button group to apply slide transition animation.

Click any of the available transition effects in the “Transition to This Slide” group. Then click the “Preview” button in the “Preview” button group to see the transition effect previewed in the slide window. After selecting a transition effect, set the properties of the transition using the “Effect Options” button within this button group.

You can change the transition effect speed. To do this, enter the amount of time to play the transition animation into the “Duration” spinner box. This spinner box appears in the “Timing” button group.

To play a sound during the transition, select a choice from the “Sound” dropdown in the “Timing” button group. To play a custom sound, select the “Other sound...” choice from the button’s dropdown menu. In the “Add Audio” dialog box that appears, navigate to the folder that contains the sound file to use. Then double-click to select it. It is important to note that the sound must be a “WAV” file type.

Next, in the “Advance Slide” section of the “Timing” button group, set how to advance the slide during your presentation. You can either advance the slide by mouse click and/or automatically advance the slide after a predetermined time interval. To advance to the next slide when you click your mouse button, ensure the “On Mouse Click” checkbox is checked. To automatically advance the slide, check the “After:” checkbox. Then enter a time duration into the small spinner box to the right. Also ensure the “Use timings” checkbox is checked in the “Set Up” button group on the “Slide Show” tab.

You can apply the selected transition to all presentation slides after applying it to the currently selected slide. To do this, click the “Apply to All” button in the “Timing” button group.

Slide Transition Animation in PowerPoint:

1. **To apply slide transition animation in PowerPoint**, first select the slide(s) to which you want to apply transition animation.
2. These slides appear in the “Slides” pane at the left side of the “Normal” view.
3. Then click the “Transitions” tab in the Ribbon.

4. Then use the buttons and options in the “Transition to This Slide” button group to apply slide transition animation.
5. Click any of the available transition effects in the “Transition to This Slide” group.
6. Then click the “Preview” button in the “Preview” button group to see the transition effect previewed in the slide window
7. After selecting a transition effect, set the properties of the transition using the “Effect Options” button within this button group.
8. **To change the animation speed**, enter a duration, in seconds, into the “Duration” spinner box in the “Timing” button group.
9. **To play a sound during the transition**, select a choice from the “Sound” dropdown in the “Timing” button group.
10. **If you want to play a custom sound**, select the “Other sound...” choice from the button’s dropdown menu.
11. In the “Add Audio” dialog box that appears, navigate to the folder that contains the sound file to use.
12. Then double-click to select it. It is important to note that the sound must be a “WAV” file type.
13. **To advance to the next slide when you click your mouse button**, check the “On Mouse Click” checkbox.
14. This checkbox appears in the “Advance Slide” section of the “Timing” button group.
15. **To automatically advance the slide**, check the checkbox for “After:” in the “Advance Slide” section of the “Timing” button group.
16. Then enter a time duration into the small spinner box to the right.
17. Also ensure the “Use timings” checkbox is checked in the “Set Up” button group on the “Slide Show” tab.
18. **To apply the selected transition to all presentation slides**, click the “Apply to All” button in the “Timing” button group.

Printing Handouts:

Handouts are paper copies of your PowerPoint presentation that you give to the audience. They give your audience something tangible to refer to and to take home. They can also write on the handouts to make their own notes. (Some handout layouts even include lines for writing.)

When you print in PowerPoint, you have a choice of the type of printout you want. (Technically you can use any of these printout types as handouts, although the Handouts type is obviously custom-made for that purpose.) Here are the choices available:

- **Full Page Slides:** A full-page copy of one slide per sheet.
- **Notes Pages:** One slide per page, but with the slide occupying only the top half of the page. The bottom half is devoted to any speaker notes you typed into PowerPoint.
- **Outline View:** A text-only version of the presentation, structured as an outline, with the slide titles as the top-level outline items.
- **Handouts:** Multiple slides per page (two to nine, depending on your choice of settings), suitable for giving to the audience to take home.

Different numbers of slides per page have different layouts. For example, if you choose three slides per page, the layout has lines next to each slide so the audience can take notes.

To print handouts, follow these steps:

1. Click the File tab, and click Print.
2. Enter the desired number of copies.
3. Choose a different printer if needed from the Printer drop-down list.
4. Click Full Page Slides to open a menu.

From the Print page in Backstage view, set print options for the handouts.

5. Click one of the layouts in the Handouts section of the menu.

Presenter view provides tools for managing a running presentation.

6. Adjust any other print settings as needed.
7. Click Print to print the handouts.

Click Print to submit the print job to your printer.

When you print handouts from PowerPoint, the Handout Master's settings determine the details of how the handouts appear. You may want to customize the Handout Master before you print. The Handout Master settings apply only when you're printing the Handouts layouts, not when printing full-page slides, notes pages, or outline view.

To customize a handout master:

1. On the View tab, click Handout Master.

Choose Handout Master.

2. If you see a message about edits being lost when saved to the server, click Check Out.
3. Open the Slides Per Page drop-down list and select the layout you want to modify.

Choose which handout master layout to modify.

4. To change the orientation, click Handout Orientation and then click Portrait or Landscape.
5. To change the slide size, click Slide Size and then click Standard or Widescreen.
6. To remove any of the placeholders (in the four corners of the page), clear its check box on the Handout Master tab.
7. To change the theme, select a different one from the Themes button's menu.
8. To change the Colors, Fonts, or Effects, make a selection from those buttons' menus.
9. To add a background color to the handout, select one from the Background Styles buttons menu.
10. Click Repeat steps 3-9 to modify other layouts if desired.
11. Click Close Master View.

Using a background style for something designed to be printed, like a handout, will use a lot of printer ink, which can be expensive.

Generating Standalone Presentation viewer:

Compiling a PowerPoint Presentation to a standalone application is very comfortable move. However, many users still aren't aware of this handy trick. I guess you are already aware of the term 'Standalone', It is an application that doesn't require any additional programs or addons to run.

By making it standalone, you can share the presentation files on the go, without any hassle. The receivers do not necessarily need Microsoft Office or PowerPoint installed on their PC.

How To Make Standalone Presentations

- First open the Presentation, which you wish to convert into a standalone program. Click Save As -> and choose 'PowerPoint Show (.PPS)' from the dropdown of format selection.
- Then run the file and choose **Package for CD**, if you would like to set up Autorun.
- When up for final presentation, export the .PPT as .PPS to easily run the slideshow without accessing the toolbars and edit area.

Using Software

- There are literally hundreds of tools which offer Free PowerPoint to EXE conversion services.
- One of the best tools is VaySoft. Just run the application and choose the Source PowerPoint Presentation file and the destination directory path for the converted file.
- Tick 'Generate Autorun for CD/DVD', if you wish to play it automatically when a CD or DVD loads up.
- You can tweak around with Logo Setup and PowerPoint viewer options.
- These tools make your presentation accessible to everyone without any PowerPoint viewer installed on your PC.

Benefits Of Standalone Presentations

- You can directly launch the slideshow, without opening PowerPoint editor.
- The receivers do not need PowerPoint installed for viewing the presentation on their system.
- This makes portability a lot more flexible, because can share the presentation with anyone.
- Compress the files and images into a single executable file.
- However, one drawback is executable files are vulnerable to malicious virus and malware and a few users may be reluctant to download and run them.

Possible Questions – UNIT IV

PART –A (1MARK)

(Online Examinations)

PART- B (2 MARK)

1. What are the different types of presentation layouts?
2. Write down the steps to add header and footer in presentation.
3. Write about any four benefits of standalone presentation.
4. What are the different types of choices available in printing a presentation?
5. What are the two types of effects used in presentation?
6. What is Anchor?
7. Write the steps to add text to shape.
8. How to apply slide layout in Normal view?
9. What are different types of menu available in presentation?
10. Name any four presentation styles.

PART-C (6 MARK)

1. Discuss about start and opening a recent/existing presentation.
2. Narrate about Presentation templates.
3. Explain about different Presentation styles.
4. Write the steps to add texts to slides.
5. Discuss in detail about slide background.
6. How to set slide transition animation in presentation?
7. Explain about insertion of tables into presentation.
8. Elaborate about adding graphics into presentation.
9. Discuss about standalone presentation.
10. Explain about Gradient fills in presentation.

KARPAGAM ACADEMY OF HIGHER EDUCATION
(Deemed University Established Under Section 3 of UGC Act 1956)
Coimbatore - 641021.

SEMESTER : I
SUBJECT CODE: 18CCU102
CLASS : I B.COM CA
UNIT- IV-MS -PowerPoint

S.NO	QUESTIONS	OPTION 1	OPTION 2	OPTION 3	OPTION 4	ANSWERS
1	In Microsoft PowerPoint two kind of sound effects files that can be added to the presentation are ____	.wav files and .mid files	.wav files and .gif files	.wav files and .jpg files	.jpg files and .gif files	.wav files and .mid files
2	Material consisting of text and numbers is best presented as	A table slide	A bullet slide	A title slide	A tilde slide	A table slide
3	What is a motion path?	A type of animation entrance effect	A method of advancing slides	A method of moving items on a slide	A movement way	A method of moving items on a slide
4	What is a slide-title master pair?	The title area and text area of a specific slide	a slide master and title master merged into a single slide	A slide master and title master for a specific design template	A pair of slides	A slide master and title master for a specific design template
5	Which of the following should you use if you want the entire slide in the presentation to have the same look?	the slide layout option	add a slide option	outline view	a presentation design template	a presentation design template
6	In the context of animations, what is a trigger?	An action button that advances to the next slide	An item on the slide that performs an action when clicked	The name of a motion path	Starts the slide show	An item on the slide that performs an action when clicked
7	If you have a PowerPoint show you created and want to send using email to another email message	Inclusion	Attachment	Reply	Forward	Attachment
8	In order to edit a chart, you can	Triple click the chart object	Click and drag the chart object	Double click the chart object	Click the chart object	Double click the chart object
9	To exit the PowerPoint ____	click the application minimize button	click the document close button	double click the applications control menu icon	double click the document control menu icon	double click the applications control menu icon
10	To preview a motion path effect using the custom animation task pane, you should	click the play button	click the show effect button	double click the motion path	click the motion path	click the play button
11	You can create a new presentation by completing all of the following except	Clicking the new button on standard toolbar	Clicking file, new	Clicking file open	Pressing ctrl + N	Clicking file open
12	To select one hyperlink after another during a slide presentation, what do you press?	Tab	Ctrl + K	Ctrl + h	ctrl+shift	Tab
13	The special effects used to introduce slides in a presentation are called	effects	custom animations	transitions	present animations	transitions
14	What is the term used when you press and hold the left mouse key and move the mouse around the slide?	Highlighting	Dragging	Selecting	Moving	Dragging
15	Which of the following toolbars provide different options in various master views?	Common tasks toolbar	Drawing toolbar	Formatting toolbar	Standard toolbar	Common tasks toolbar
16	How can you create a uniform appearance by adding a background image to all slides?	Create a template	Edit the slide master	Use the autocorrect wizard	copy	Edit the slide master
17	What is the term used when a clip art image changes the direction of faces?	Group	Flip	Rotate	maximize	Rotate
18	The slide that is used to introduce a topic and set the tone for the presentation is called	table slide	graph slide	bullet slide	title slide	title slide
19	Which of the following features should you use when typing in the notes text box?	Slide show	Insert	Slide maser	Zoom	Zoom
20	Which of the following should be used when you want to add a slide to an existing presentation?	File, add a new slide	Insert, New slide	File Open	File, New	Insert, New slide
21	Which of the following tool enables you to add text to a slide without the standard placeholders?	Text tool box	Line tool	Drawing tool	Auto shapes tool	Text tool box
22	Objects on the slide that hold text are called	Placeholders	Object holders	Auto layouts	Text holders	Placeholders
23	Which command brings you to the first slide in your presentation?	Next slide button	Page up	Ctrl + Home	Ctrl + End	Ctrl + Home
24	With which of the following allow you to select more than one slide in a presentation?	Alt + Click each slide	Shift + drag each slide	Shift + Click each slide	Ctrl + Click each slide	Shift + Click each slide
25	The PowerPoint view that displays only text title and bullets is	Slide show	Slide sorter view	Notes page view	Outline view	Outline view
26	In Microsoft PowerPoint the entry effect as one slide replaces another in a show is called a ____	animation	slide transition	custom animation	present animation	slide transition
27	In Microsoft PowerPoint in order to see all the slides on one screen use	view, slide sorter	view, slide	view, master	view, slide show	view, slide sorter
28	Which of the following options changes the fill colour of an object back to the default colour?	Template	Automatic	Patterns	Fill colors	Automatic
29	Which of the following should be used with the mouse when you want to draw a perfect shape?	The spacebar	The alt key	The ctrl key	The shift key	The shift key
30	When an image is selected, it displays which of the following?	Two corner handles	Six middle handles	Eight sizing handles	Six boxes	Eight sizing handles
31	You can create a new presentation by completing all of the following except	Clicking the new button standard toolbar	Clicking file, new	Clicking file open	Pressing ctrl + N	Clicking file open
32	To select one hyperlink after another during a slide presentation, what do you press?	Tab	Ctrl + K	Ctrl + h	All of above	Tab
33	Special effects used to introduce slides in a presentation are called	effects	custom animations	transitions	present animations	transitions
34	What is the term used when you press and hold the left mouse key and move the mouse around the slide?	Highlighting	Dragging	Selecting	Moving	Dragging
35	How can you create a uniform appearance by adding a background image to all slides?	Create a template	Edit the slide master	Use the autocorrect wizard	All of the above	Edit the slide master
36	Which types of fonts are best suitable for titles and headlines	serif fonts	sans serif fonts	text fonts	picture fonts	sans serif fonts

37	Which of the following will not advance the slides in a slide show view?	The esc key	The space bar	The enter key	The mouse button	The esc key
38	Slide show options available to the presenter include all of the following except	Transitions command	Speaker notes command	Meeting minder command	Navigation commands	Transitions command
39	The quickest way to create a PowerPoint presentation is to use the	Word for windows templates	Auto creation wizard	Auto content wizard	Presentation wizard	Auto content wizard
40	In which menu can you find features Slide Design, Slide Layout	Insert Menu	Format Menu	Tools Menu	Slide Show Menu	Format Menu
41	Which menu provides you options like Animation Scheme, custom Animation, Slide Transition?	Insert Menu	Format Menu	Tools Menu	Slide Show Menu	Slide Show Menu
42	In a presentation, which type chart would be used to show trends over time?	Column	Line	Bar	Pie	Line
43	PowerPoint's default view is the _____ view.	Slide Show	Notes	Normal	Outline	Normal
44	The _____ pane is used to edit text, images, and other slide objects	Notes	Picture	Slide	Edit	Slide
45	You can change the screen size by clicking Slide Size on the _____ tab.	Home	Slide Show	View	Design	Design
46	Which of the following is NOT a method of advancing to the next slide during a presentation?	Using a mouse	Using voice control	Using the keyboard	Swiping on a touch screen	Using voice control
47	During a presentation, pressing _____ will advance to the next slide.	Esc	Ctrl	Spacebar	Alt	Spacebar
48	To end a slide show, press _____.	Down arrow	F3	F5	Esc	Esc
49	When viewing a slide show, pressing _____ will display all slides	D	F3	G	F6	G
50	The Bullets button is located in the _____ tab.	Paragraph group on the Home	Paragraph group on the Design	Editing group on the Home	Editing group on the Design	Paragraph group on the Home
51	Bit-mapped images are stored as _____.	power points	points	picas	pixels	pixels
52	The _____ guide, located at the top and bottom of a slide, is used to align objects horizontally.	vertical	Smart alignment	horizontal	equidistant	vertical
53	The _____ tool allows you to change the color of a picture to better match the presentation's color scheme.	Color	Eyedropper	Recolor	Format	Color
54	The visual and audio elements that occur as slides change is called an _____.	trigger	movement	transition	animation	animation
55	All of the following are categories of transition types except	Subtle	Exciting	Organic	Dynamic Content	Organic
56	To select multiple adjacent slides, click the first slide in the range, and then press and hold _____ while clicking the last slide in the range.	Ctrl + Shift	Ctrl	Alt	Shift	Shift
57	The _____ is applied to an object after it is displayed on a slide.	Emphasis action	Exit animation	Subtle action	Entrance animation	Emphasis action
58	_____ is an online URL-shortening service that provides short aliases which can be used to redirect you to long URLs.	Small Link	IttyBittyURL	LittleLink	TinyURL	TinyURL
59	_____ mark sections of an audio or video file so the user can jump to a certain point in the file before starting the playback.	Partitions	Sectors	Bookmarks	Segments	Bookmarks
60	The _____ feature is an efficient way to insert a large number of photographs into a slide show.	Photographs	Photo Album	Memory Book	Photo Journal	Photo Album

UNIT-V**SYLLABUS**

MS Access: Introduction, Planning a Database, Starting Access, Creating a New Database, Creating Tables, Working with Forms, Creating queries, Finding information in Databases, Creating Reports, Types of Reports. Internet and World Wide Web: Introduction to Internet – Internet access – Internet Addressing – Introduction and use of Email – Working of E-mail – Email names and address – Working in Blogs

MS Access:**Introduction**

Microsoft Access is a type of database software that is used to store information for reporting, referencing and analysis. With Microsoft Access, you can analyze large amounts of data faster and more efficiently than with Excel or other types of spreadsheets.

Access is most popular for its tables, forms and queries. The database tables are similar to spreadsheets, so you shouldn't have much trouble using the basic functions of the program. However, it does take time to learn the full features.

When setting up a database, you may list the subject matter of each column, just as you would with a spreadsheet, and add as many columns as you'd like. When this is completed, each row leaves room for more data input.

One feature that users really like is that they don't need to finalize the tables manually. Also, Access has a query function that allows information to be combined from more than one table, and you can even specify the conditions. This saves a lot of time because you don't have to look through rows and rows of information.

What Types of Things Can Microsoft Access Help With?

If you're already using a spreadsheet application like Excel, you're familiar with the benefits of organizing your data. But let's look further into some of the specific tasks that you can perform with Access.

- Maintain all information for each client or customer, including addresses, invoices, payment and order information.
- Track financial data without needing a separate software program. If you have the full Microsoft Office Suite, you may even set payment reminders.
- Manage marketing and sales thanks to having all customer information in the database. Send out flyers, emails and coupons and track how customers respond.

- Track production and inventory by entering data on shipments and also knowing when it's time to order more of a particular product.
- Run reports and analyses using the reports and charts. You can basically run a report on anything within a matter of minutes, such as customers who are behind on payment.

Planning a Database:

Database objects are the main players in an Access database. Altogether, you have six different types of database objects:

- **Tables** store information. Tables are the heart of any database, and you can create as many tables as you need to store different types of information. A fitness database could track your daily running log, your inventory of exercise equipment, and the number of high-protein whey milkshakes you down each day, as three separate tables.
- **Queries** let you quickly perform an action on a table. Usually, this action involves retrieving a choice bit of information (like the 10 top-selling food items at Ed's Roadside Diner or all the purchases you made in a single day). However, you can also use queries to apply changes.
- **Forms** are attractive windows that you create, arrange, and colorize. Forms provide an easy way to view or change the information in a table.
- **Reports** help you print some or all of the information in a table. You can choose where the information appears on the printed page, how it's grouped and sorted, and how it's formatted.
- **Macros** are mini-programs that automate custom tasks. Macros are a simple way to get custom results without becoming a programmer.
- **Modules** are files that contain Visual Basic code. You can use this code to do just about anything—from updating 10,000 records to firing off an email.

When you use a database program like Access, you can't just start entering data. Instead, you need to create a relational database design, dividing your information into one or more tables, each made up of fields (which are like the columns in a spreadsheet). Tables are connected using relational joins, where a field in one table matches (relates to) a field in another. Here is the general idea.

1. Identify your data.

Make a list of the possible fields (pieces of information), including text, numeric, date, true/false, and other types of data.

2. Eliminate redundant fields.

Don't store the same information in more than one place. If you can calculate one field from another, store only one. (For example, store birth date or age, but not both.)

3. Organize the fields into tables.

Group your fields according to what they describe, so each group becomes a table. For example, an order entry database for a store might have one table for customers, one for products, and one for orders.

4. Add tables for codes and abbreviations.

Plan to include a table of state names and two-letter codes, and a table every other code or abbreviation you plan to use in the database. You'll use these tables to create dropdown lists of values you can choose from when entering records.

5. Choose a primary key for each table.

The primary key is the field that uniquely identifies each record in the table. You can tell Access to assign a unique ID number to each record by using an AutoNumber field.

6. Link the tables.

See which tables contain fields that match fields in other tables. In an order entry database, the Orders table must contain a field to identify the customer who has placed the order — a field to match the primary key field in the Customers table. Most relationships are one-to-many, where one record in one table can match more than one (or no) records in another table.

Start Access:

Access starts you out with what is, for Microsoft, a remarkably streamlined window. Here you can create a new database or open an existing one.

Recently opened databases.
Click one to open it.

Templates for new databases.
Click one to create it.

When you start Access, you see this two-part welcome page. On the left is a list of recently opened databases (if you have any). On the right is a list of templates that you can use to create a new database.

Tip

If you already have Access open and you've been working with another database, just choose File→New to create a new database. You'll get the same list of templates as when you first launch Access.

Creating a New Database:

1. Click on the **START** button on your computer and position your cursor over the **PROGRAMS** menu to view a list of installed programs. Once you see the list, position the cursor over **Microsoft Office** and then click on **Microsoft Access**.
2. After opening Access, you will be presented with the window shown in Figure.

3. If you want to edit an existing database, you can either go to **File—Open**, or move your cursor to the lower right-hand side to click on **Open**.

4. If you are creating a new database, you can also either go to **File—New**, or move your cursor to the lower right-hand side to click on **Create a new file**. You will be presented with five options on the right side menu as shown in Figure.

5. Unlike Word documents, Excel spreadsheets, and Power Point presentations, you must save an Access database before you start working on it. After selecting "Blank database", you will first be prompted to specify a location and name for the database. In the New Database dialog box, type in a name for the database and a location and click on **Create** as shown in Figure.

6. Now a new database is created as shown in Figure

Creating Tables:

This section describes how to construct data tables, enter and edit data, sort records, and find records that meet certain conditions.

Creating Tables in Design View

1. By clicking the **Table** tab on the left hand side, you will find Access provides three ways to create a table for which there are icons in the Database window.

- **Create Table in Design view** will allow you to create the fields of the table. It allows you to define the fields in the table before adding any data to the datasheet. This is the most common way of creating a table and is explained in detail below.
- **Create table by using wizard** will step you through the creation of a table.
- **Create table by entering data** will give you a blank datasheet with unlabelled columns that looks much like an Excel worksheet.

2. Double clicking on **Create table in Design view** displays the Table Design screen where you define fields for your table. The screen is divided into two parts: a top pane for entering the field name, data type, and an option description of the field and a bottom pane for specifying field properties.

Bottom Pane

1. Every table consists of fields. For each field, specify the name of the field, the type of data, and any description needed to determine what data the field contains. Pressing the **Tab** key moves the cursor from one column to the next in the Table Design screen. You can select the data type from the drop-down list in the Data Type column as shown in Figure.

4. Each table in your database should have a “primary key.” A primary key is a field that uniquely identifies each record in the database. In a database of book collection, there might be two books with the same author so author is not a good primary key. However, every book has a unique “call number”, so “call number” would be a good choice for a primary key. To set the primary key for your table, highlight the key field and choose **Primary Key** from the Edit menu.

5. When the primary key is set, you should find a little key icon next to the field name on the left side. Note: To remove a primary key, simply repeat this procedure to toggle the primary key off.

Field Name	Data Type	Description
 Call Number	Text	
Title	Text	
Author	Text	
Year	Date/Time	
Subject	Text	

6. As a final step, the table must be saved. Pull down the File Menu to choose **Save**. A dialogue box will pop up where the name of the new table should be specified. Access gives a default name such as “Table1” or “Table2.” Simply type over this default name with the name of the table. For this example, name the table “Book_Info”, then click **OK**.

7. At this point, the new table has been created and saved. Switch back to the Access main screen by pulling down the File menu and choosing **Close**. This will *close* the Design View for the table and display the Access main screen. Notice that the new Book_Info table appears below the Table tab.

Adding and Deleting Fields to Tables

Even the best planned database will sometimes require you to add or delete a field in the Design View. To add a new field, select the row you want to insert above and choose “Row” from the Insert menu. If you need to delete a field, select the row containing the field and choose “Delete Row” from the Edit menu.

You can also move fields in the table design. Select the field you want to move by clicking on its row. A black triangle will appear to indicate the field is selected. Then, drag the field to the new location.

Cautions to Modifying your Table Design Structure

- Backup your table before you make any modifications to it.

- Deleting a field will delete the records in the field.
- If you delete a field and that field is used in any of your forms, queries or reports, you must also delete that field from these other documents.
- Renaming a field will have the same effect on a table as deleting the field.
- Resizing a field (making it smaller) may truncate the data in your forms or reports.

Entering and Editing Data

1. After you have defined fields in the table, you can enter data. Highlight the table, choose **Open** from the database window menu bar. This displays a grid with field names across the top and a row for each record of the database as shown in Figure 11.

Call Number	Title	Author_First_Na	Author_Last_Nam	Year	Subject
QA 76.9 D3 B57	Microsoft Acces	Iris	Blanc	2002	Database management
QA 76.9 D314 R6	Microsoft Acces	Garry	Robinson	2004	Database management
QA 76.9 D3 A495	Microsoft Acces	Michael	Alexander	2006	Database management
*				0	

Record: 3 of 3

2. To enter data, simply click the mouse in the field you want to enter and type a value. Press the **Tab** key to move from field to field. When you are in the last field of a record, pressing the Tab key automatically creates a new record for you.
3. The table in Figure is shown in Datasheet View. Use the **Datasheet View** to add, delete, and move records.
4. To save the new data, pull down the **File** menu and choose **Save**.
5. To navigate to other records in the table, use the navigation bar at the bottom of the screen:

Working with Forms:

Creating Forms

There are a few methods you can use to create forms in Access. For this, open your Database and go to the **Create** tab. In the Forms group, in the upper right-hand corner you will see the Form Wizard button.

Click on that button to launch the Form Wizard.

On this first screen in the wizard, you can select fields that you want to display on your form, and you can choose from fields from more than one table or a query.

Let us assume we want to simply have a quick form that we are going to use for data entry for our employee information.

From **Tables/Queries** drop-down list, select **tblEmployees** table. Click on the double arrow to move all the fields at once.

Form Wizard

Which fields do you want on your form?
You can choose from more than one table or query.

Tables/Queries
Table: tblEmployee

Available Fields:
EmployeeID
FirstName
LastName
Address1
Address2
City
State
Zip

Selected Fields:

Cancel < Back **Next >** Finish

Let us just leave it with that one table, and click **Next**.

Form Wizard

Which fields do you want on your form?
You can choose from more than one table or query.

Tables/Queries
Table: tblEmployee

Available Fields:

Selected Fields:
Address2
City
State
Zip
Phone
PhoneType
Email
JobTitle

Cancel < Back **Next >** Finish

The following screen in the Form Wizard will ask for the layout that we would like for our form. We have **columnar**, **tabular**, **datasheet** and **justified** layouts. We will choose the columnar layout here and then click **Next**.

In the following screen, we need to give a title for our form. Let us call it **frmEmployees**.

Once you have given your form a title, you can open the form to see what that form looks like, or you can begin entering information into your table. Or you can choose the option to modify the form's design. Let us choose the first option to **open the form to view or enter information** and click **Finish**.

Now, take a look at the following screenshot. This is what your form looks like. This is a single item form, meaning one record is displayed at a time and further down you can see the navigation buttons, which is telling us that this is displaying the record 1 of 9. If you click on that button then, it will move to the next record.

If you want to jump to the very last record in that form or that table, you can use the button right beside that right arrow, the arrow with a line after it, that's the last record button. If you want to add new employee information, go to the end of this records and then after 9 records you will see a blank form where you can begin entering out the new employee's information.

This screenshot shows the Microsoft Access interface with the 'frmEmployee' form open. The form contains the following data:

Field	Value
Employee ID	
FirstName	Janell
LastName	Frank
Address1	6433 Morgan Ln
Address2	Optional
City	Schaumburg
State	IL
Zip	60193
Phone	(224) 555-8631
Phone Type	Home
Email	jfrank@mycompany.com
JobTitle	Accounting Manager

The status bar at the bottom indicates 'Record: 11 of 10'.

This screenshot shows the Microsoft Access interface with the 'frmEmployee' form open. The form is in a 'New' state, indicated by a '[New]' label in the top right corner of the data entry area. The fields are empty, ready for input:

Field	Value
Employee ID	[New]
FirstName	
LastName	
Address1	
Address2	
City	
State	
Zip	
Phone	
Phone Type	
Email	
JobTitle	

The status bar at the bottom indicates 'Record: 11 of 10'.

This is one example of how you can create a form using the Form Wizard. Let us now close this form and go to the Create tab. Now we will create a slightly more complicated form using Wizard. Click the Form Wizard and this time, we will choose fields from a couple of different tables.

In this Form Wizard, let us choose **tblProjects** for **Tables/Queries**, and select a few Available Fields such as ProjectID, ProjectName, ProjectStart, and ProjectEnd. These fields will now move to Selected Fields.

The screenshot shows the 'Form Wizard' dialog box in Microsoft Access. At the top, it asks 'Which fields do you want on your form?' and states 'You can choose from more than one table or query.' Below this, the 'Tables/Queries' section has a dropdown menu set to 'Table: tblProjects'. The 'Available Fields' list on the left contains: Contracts.FileName, Contracts.FileTimeStamp, Contracts.FileType, Contracts.FileURL, Budget (highlighted), ProjectNotes, OutOfPrint, and DateAdded. The 'Selected Fields' list on the right contains: ProjectID, ProjectName, ProjectStart, and ProjectEnd. Between the two lists are four arrow buttons: a single arrow pointing right, a double arrow pointing right, a single arrow pointing left, and a double arrow pointing left. At the bottom, there are four buttons: 'Cancel', '< Back', 'Next >' (which is highlighted with a blue border), and 'Finish'.

Now select **tblTasks** for Tables/Queries and send over the TaskID, ProjectID, TaskTitle, StartDate, DueDate and PercentComplete. Click **Next**.

Here, we want to retrieve data from a couple of different objects. We can also choose from options on how we want to arrange our form. If we want to create a flat form, we can choose to arrange by **tblTasks**, which will create that single form, with all the fields laid out in flat view as shown below.

However, if we want to create a hierarchical form based on that one-to-many relationship, we can choose to arrange our data by tblProjects.

Form Wizard

Which fields do you want on your form?

You can choose from more than one table or query.

Tables/Queries
Table: tblTasks

Available Fields:

- Description
- Attachments
- Attachments.FileData
- Attachments.FileFlags
- Attachments.FileName
- Attachments.FileTimeStamp
- Attachments.FileType
- Attachments.FileURL

Selected Fields:

- ProjectStart
- ProjectEnd
- TaskID
- tblTasks.ProjectID
- TaskTitle
- StartDate
- DueDate
- PercentComplete

Buttons: Cancel, < Back, Next >, Finish

Form Wizard

How do you want to view your data?

by tblProjects
by tblTasks

tblProjects_ProjectID, ProjectName, ProjectStart, ProjectEnd, TaskID, tblTasks_ProjectID, TaskTitle, StartDate, DueDate, PercentComplete

☒ Single form ☐ Linked forms

Buttons: Cancel, < Back, Next >, Finish

The Form Wizard dialog box is titled "Form Wizard". It asks "How do you want to view your data?". On the left, there is a list box with "by tblProjects" selected and "by tblTasks" below it. On the right, there is a preview of the form structure showing fields: "tblProjects_ProjectID, ProjectName, ProjectStart, ProjectEnd" and a subform containing "TaskID, tblTasks_ProjectID, TaskTitle, StartDate, DueDate, PercentComplete". At the bottom, there are two radio buttons: "Form with subform(s)" (which is selected) and "Linked forms". At the very bottom are four buttons: "Cancel", "< Back", "Next >" (which is highlighted with a blue border), and "Finish".

In the above window, we have the option to include a **subform** for **tblTasks**, or we can make that a linked form. This linked form is where tblProjects will have a button that will launch that second form filtered to the project that we have selected in that underlying projects form. Let us now select the **Form with subform(s)**, and then click **Next**.

In the following screen, you can choose a layout for your subform. The Datasheet View gets selected by default. The Datasheet View is similar to Table View. Now, click **Next**.

The Form Wizard dialog box is titled "Form Wizard". It asks "What layout would you like for your subform?". On the left, there is a preview of a subform in Datasheet View, showing a table with multiple columns and rows. On the right, there are two radio buttons: "Tabular" and "Datasheet" (which is selected). At the bottom are four buttons: "Cancel", "< Back", "Next >" (which is highlighted with a blue border), and "Finish".

In the following screen, you need to provide a name for your forms. Enter the name you want and click **Finish**.

Form Wizard

What titles do you want for your forms?

Form:

Subform:

That's all the information the wizard needs to create your form.

Do you want to open the form or modify the form's design?

☒ Open the form to view or enter information.

☐ Modify the form's design.

Buttons: Cancel, < Back, Next >, **Finish**

Access will give you a preview of what your form looks like. On top, you have the controls on your main form, which is from our **Projects** table. As you go down, you will see a subform. It's like a form within a form.

frmProjects

Project ID: 37

Project Name: Cash is King: How to Cut Your Spending by Carrying Cash

Project Start: 6/10/2013

Project End:

Subform: frmSubTasks

Task ID	ProjectID	Task Title	Start Date
37	37	Create Outline	6/10/2013
25	37	Hire Technical Reviewer	6/10/2013
(New)	37		

Record: 1 of 2

Multiple Item Form

You may also want to create a specific kind of form. For this, you can click on the **More Forms** drop-down menu.

From the menu, you can create a **Multiple Items** form, a **Datasheet** form, a **Split** form, or even a **Modal Dialog** form. These are typically bound forms; select the object that you would like to be bound to that form. This does not apply to the Modal Dialog forms.

To create this type of form, you will need to select the object in navigation pane first. Let us select **tblEmployees** here.

Proceed by clicking on **More Forms** and **Multiple Items**.

The above step will further create a Multiple Items form, listing out all the employees.

Split Form

This type of form is divided in equal halves, either vertically or horizontally. One half displays a single item or record, and the other half displays a list or a datasheet view of multiple records from the underlying data source.

Let us now select **tblEmployees** in the navigation pane and then on **Create** tab. Select **Split Form** option from More Forms menu and you will see the following form in which the form is divided vertically.

Creating Queries:

A query is simply a question you ask a database. How many books are written by a certain author? Who wrote a book in a certain year? Queries select records from one or more tables in a database that match the criteria you set, they can be viewed, analyzed, and sorted on a common datasheet. The resulting collection of records, called a **dynaset** (short for dynamic subset), is saved as a database object and can therefore be easily used in the future. The query will be updated whenever the original tables are updated.

1. To construct a query, Click on the **New** button in the database window as shown in Figure. Choose **Design View**, click **OK**.

2. In the **Show Table** dialog box as shown in Figure, you will be asked to choose a table/tables for the query. Select the tables you want to query and click **Add**.

3. Add fields from the tables to the new query by double-clicking the field name in the table boxes or selecting the field from the **Field** and **Table** drop-down menus on the query form as shown in Figure 18. Specify sort orders if necessary.

4. Enter the criteria for the query in the **Criteria** field. The **Expression Builder**  can also be used to assist in writing the expressions in the **Criteria** field.

5. After you have selected all of the fields and tables, click the **Run**  button on the toolbar to execute the query. Figure 19 shows the query result, records that match the criteria you set.

Author_ID	Title	Author_LastName
1	Microsoft Access	Alexander

Choose **Save** from the **File** menu to save a query for later execution.

Finding information in Databases:

A query is a request for data results, and for action on data. You can use a query to answer a simple question, to perform calculations, to combine data from different tables, or even to add, change, or delete table data.

- As tables grow in size they can have hundreds of thousands of records, which makes it impossible for the user to pick out specific records from that table.
- With a query you can apply a filter to the table's data, so that you only get the information that you want.
- Queries that you use to retrieve data from a table or to make calculations are called select queries.
- Queries that add, change, or delete data are called action queries.
- You can also use a query to supply data for a form or report.
- In a well-designed database, the data that you want to present by using a form or report is often located in several different tables.
- The tricky part of queries is that you must understand how to construct one before you can actually use them.

Create Select Query

If you want to review data from only certain fields in a table, or review data from multiple tables simultaneously or maybe just see the databased on certain criteria, you can use the **Select** query. Let us now look into a simple example in which we will create a simple query which will retrieve information from **tblEmployees** table. Open the database and click on the **Create** tab.

The screenshot shows the Microsoft Access application window with the 'tblEmployees' table open in Datasheet view. The 'Create' tab is selected in the ribbon. The table contains 11 records of employee data.

Employee ID	FirstName	LastName	JobTitle	Address1	Address2	City	State	Zip
2	Rex	Clay	Accounting Assistant	2556 Mohave S	Optional	Schaumburg	IL	60194
3	Janell	Frank	Accounting Manager	6433 Morgan Ln	Optional	Schaumburg	IL	60193
4	Claudine	Goff	Administrative Assistant	21 Berkley Ln	Optional	Schaumburg	IL	60195
5	Annemarie	Marks	Accounting Assistant	91 Forest Ln	Optional	Schaumburg	IL	60193
6	Cecil	Snyder	Accounting Assistant	64 Osage Ln	Optional	Schaumburg	IL	60194
7	Elvis	Manning	Office Coordinator	4753 Green Riv	Optional	Schaumburg	IL	60193
8	Delores	Townsend	Administrative Assistant	1215 Cloverdal	Optional	Schaumburg	IL	60194
9	Ruthie	Higgins	Marketing Coordinator	9876 Kingsley t	Optional	Schaumburg	IL	60193
10	Mark	Pollard	Marketing Coordinator	4685 Stanley Ct	Optional	Schaumburg	IL	60194
11	Todd	Watson	Marketing Coordinator	846 Bode Rd	Apt 129	Schaumburg	IL	60194
(New)								

Click **Query Design**.

In the **Tables** tab, on the **Show Table** dialog, double-click the **tblEmployees** table and then **Close** the dialog box.

In the tblEmployees table, double-click all those fields which you want to see as result of the query. Add these fields to the query design grid as shown in the following screenshot.

Now click **Run** on the **Design** tab, then click **Run**.

The query runs, and displays only data in those field which is specified in the query.

Creating Reports:

You can create a variety of different reports in Microsoft Office Access 2007, ranging from the simple to the complex. Begin by thinking about your report's record source. Whether your report is a simple listing of records or a grouped summary of sales by region, you must first determine which fields contain the data you want to see in your report, and in which tables or queries they reside.

After you choose your record source, you will usually find it is easiest to create your report by using the Report Wizard. The Report Wizard is a feature in Access that guides you through a series of questions and then generates a report based on your answers.

Choose a record source

A report consists of information that is pulled from tables or queries, as well as information that is stored with the report design, such as labels, headings, and graphics. The tables or queries that provide the underlying data are also known as the report's record source. If the fields that you want to include all exist in a single table, use that table as the record source. If the fields are contained in more than one table, you need to use one or more queries as the record source. Those queries may already exist in your database, or you may need to create new queries specifically to fit the needs of your report.

Use a query as a record source for a report using the Report Wizard

1. On the **Create** tab, in the **Reports** group, click **Report Wizard**.
 - a. The Report Wizard starts.
2. In the **Tables/Queries** combo box, click the name of the query that you want to use as the report's record source.
3. **Note:** The query must already exist.
4. In the **Available Fields** list box, double-click each field that you want to use.
 - a. When you double-click a field, it is added to the **Selected Fields** list box.

Set the Record Source property to a query in report Design view

1. On the **Create** tab, in the **Reports** group, click **Report Design**.
2. **Note:** If you see a **Simple Report** button instead of a **Report Design** button, click the arrow next to **Simple Report**, and then click **Report Design**.
3. If the report property sheet is not already open, press **F4** to open it.

4. In the report property sheet, on the **Data** tab, click the **Record Source** property box.
5. **Note:** If you don't see a **Record Source** property box, make sure that you are viewing the properties for the report itself, rather than the properties for a particular control that is on the report.
6. Do one of the following:

Start typing the name of the query you want to use as the report's record source. ☐

Access automatically fills in the name of the object as you type.

Click the down arrow and then select the query that you want to use from the drop-down list that appears.

Create a report by using the Report tool

The Report tool provides the fastest way for you to create a report, because it generates a report immediately without prompting you for information. The report displays all the fields from the underlying table or query. The Report tool may not create the final, polished product that you ultimately want, but it is quite useful as a means to quickly look at the underlying data. You can then save the report and modify it in Layout view or Design view so that it better serves your purposes.

1. In the Navigation Pane, click the table or query on which you want to base the report.
2. On the **Create** tab, in the **Reports** group, click **Report** .

Access builds the report and displays it in Layout view.

After viewing the report, you can save it and then close both the report and the underlying table or query that you used as a record source. The next time that you open the report, Access will display the most recent data from your record source.

Create a report by using the Report Wizard

You can use the Report Wizard to be more selective about what fields appear on your report. You can also specify how the data is grouped and sorted, and you can use fields from more than one table or query, provided you have specified the relationships between the tables and queries beforehand.

- On the **Create** tab, in the **Reports** group, click **Report Wizard**.
- Follow the directions on the Report Wizard pages. On the last page, click **Finish**. When you preview the report, you see the report as it will appear in print.

Note: If you want to include fields from multiple tables and queries in your report, do not click **Next** or **Finish** after you select the fields from the first table or query on the first page of the Report Wizard. Instead, repeat the steps to select a table or query, and click any additional fields that you want to include in the report. Then, click **Next** or **Finish** to continue.

Create a report by using the Blank Report tool

If you aren't interested in using the Report tool or the Report Wizard, you can use the Blank Report tool to build a report from scratch. This can be a very quick way to build a report, especially if you plan to put only a few fields on your report.

- On the **Create** tab, in the **Reports** group, click **Blank Report** .

A blank report is displayed in Layout view, and the **Field List** pane is displayed on the right side of the Access window.

- In the **Field List** pane, click the plus sign next to the table or tables containing the fields that you want to see on the report.
- Drag each field onto the report one at a time, or hold down **CTRL** and select several fields, and then drag them onto the report at the same time.
- Use the tools in the **Controls** group on the **Format** tab to add a logo, title, page numbers, or the date and time to the report.

Understand controls

Controls are objects that display data, perform actions, and let you view and work with information that enhances the user interface, such as labels and images. Access supports three types of controls: bound, unbound, and calculated:

- ☐ **Bound control:** A control whose source of data is a field in a table or query is a bound control. You use bound controls to display values from fields in your database. The values can be text, dates, numbers, Yes/No values, pictures, or graphs. A text box is the most common type of bound control. For example, a text box on a report that displays an employee's last name might get this information from the Last Name field in the Employees table.
- ☐ **Unbound control:** A control that doesn't have a source of data (a field or expression) is an unbound control. You use unbound controls to display information, lines, rectangles, and pictures. For example, a label that displays the title of a report is an unbound control.
- ☐ **Calculated control:** A control whose source of data is an expression rather than a field is a calculated control. You specify the value that you want in the control by defining an *expression* as the source of data for the control. An expression is a combination of operators (such as = and +), control names, field names, functions that return a

single value, and constant values. For example, the following expression calculates the price of an item with a 25 percent discount by multiplying the value in the Unit Price field by a constant value (0.75).

$$= [\text{Unit Price}] * 0.75$$

An expression can use data from a field in the report's underlying table or query, or from a control in the report.

When you create a report, it is probably most efficient to add and arrange all the bound controls first, especially if they make up the majority of the controls on the report. You can then add the unbound and calculated controls that complete the design by using the tools in the **Controls** group on the **Design** tab.

You bind a control to a field by identifying the field from which the control gets its data. You can create a control that is bound to the selected field by dragging the field from the **Field List** pane to the report. The **Field List** pane displays the fields of the report's underlying table or query. To display the **Field List** pane, on the **Design** tab, in the **Controls** group, click **Add Existing Field**.

Alternatively, you can bind a field to a control by typing the field name in the control itself or in the box for the **Control Source** value in the control's property sheet. The property sheet defines the characteristics of the control, such as its name, the source of its data, and its format.

Using the **Field List** pane is the best way to create a control for two reasons:

2. A bound control has an attached label, and the label takes the name of the field (or the caption defined for that field in the underlying table or query) as its caption by default, so you don't have to type the caption yourself.
3. A bound control inherits many of the same settings as the field in the underlying table or query (such as for the **Format**, **Decimal Places**, and **Input Mask** properties). Therefore, you can be sure that these properties for the field remain the same whenever you create a control that is bound to that field.

If you already created an unbound control and want to bind it to a field, set the control's **Control Source** property to the name of the field.

Save your work

After you save your report design, you can run the report as often as you need to. The report's design stays the same, but you get current data every time you print the report. If your reporting needs change, you can modify the report design or create a new, similar report based on the original.

Save your report design

6. Click the **Microsoft Office Button**  and then click **Save**, or press **CTRL+S** .
7. If the report is untitled, type a name in the **Report Name** box, and then click **OK**.

Save your report design under a new name

- 1) Click the **Microsoft Office Button** , and then click **Save As**
- 2) In the **Save As** dialog box, type a name in the **Save Report to** box, select **Report** in the **As** box, and then click **OK**.

Category	Product Name	ID	List Price
Beverages	Northwind Traders Beer	34	\$14.00
Beverages	Northwind Traders Coffee	43	\$46.00
Beverages	Northwind Traders Tea	1	\$18.00
Condiments	Northwind Traders Syrup	3	\$10.00
Condiments	Northwind Traders Cajun Seasoning	4	\$22.00
Condiments	Northwind Traders Okra	66	\$17.00

Types of Report:

1) Create a grouped or summary report

Information is often easier to understand when it is divided into groups. For example, a report that groups sales by region can highlight trends that otherwise might go unnoticed. In addition, placing totals at the end of each group in your report can replace a lot of manual interaction with a calculator.

Microsoft Office Access 2007 makes working with grouped reports easy. You can create a basic grouped report by using the Report Wizard, you can add grouping and sorting to an existing report, or you can revise grouping and sorting options that have already been defined.

About grouping and sorting

When you print a report, you usually want to organize the records in a particular order. For example, if you're printing a list of suppliers, you might want to sort the records alphabetically by company name. For many reports, sorting the records isn't enough. You may also want to divide them into groups.

A *group* is a collection of records, along with any introductory and summary information displayed with the records, such as a header. A group consists of a group header, nested groups (if any), detail records, and a group footer.

You can see how grouping works by comparing the List of Products by Category report (shown in the illustration) to the datasheet for its underlying query, Product List. Both the report and the query sort products by category, but the report also prints the name of each category on a separate line at the beginning of each group (in the group header) and the number of products for each category on a separate line at the end of each group (in the group footer).

Category	Product Name	List Price
Beverages	Northwind Traders Beer	\$14.00
Beverages	Northwind Traders Coffee	\$46.00
Beverages	Northwind Traders Tea	\$18.00
Count: 3		
Condiments	Northwind Traders Syrup	\$10.00
Condiments	Northwind Traders Cajun Seasoning	\$22.00
Count: 2		

- 1** The category name appears in every row in the datasheet.
- 2** The category name appears once for each group in the report, in the group header.
- 3** The total for the category appears at the end of each group, in the group footer.
- 4** The records appear as one large group in the datasheet.
- 5** The records for each category appear as a separate section in the report, preceded by a group header and followed by a group footer.

You can group on any fields and expressions you sort on (up to 10). You can group on the same field or expression more than once. When you group on more than one field or expression, Office Access 2007 nests the groups according to their group level. The first field you group on is the first and most significant group level; the second field you group on is the next group level; and so on.

You usually use a group header to display data that identifies the group in a separate section at the beginning of the group. You usually use a group footer to summarize the data in the group in a separate section at the end of the group.

Change the priority of grouping and sorting levels

To change the priority of a grouping or sorting level, click the row in the **Group, Sort, and Total** pane and then click the up arrow or the down arrow on the right side of the row.

Delete grouping and sorting levels

To delete a grouping or sorting level, click the row you want to delete in the **Group, Sort, and Total** pane, and then press **DELETE** on your keyboard or click the **Delete** button on the right side of the row. When you delete a grouping level, if the grouping field was in the group header or footer, Access moves it to the report's Detail section. Any other controls that were in the group header or group footer are deleted.

Add grouping, sorting, and totals in Layout view

You can perform simple sorting, grouping and totaling operations by right-clicking fields in Layout view and then choosing the operation you want from the shortcut menu.

Note: Although the instructions in this section do not use the **Group, Sort, and Total** pane directly, it is a good idea to open the pane and observe how it changes as you work. You will get a better idea of what Access is doing and, as you get more comfortable working with the **Group, Sort, and Total** pane, you can use it to make additional adjustments to your report. To display the **Group, Sort, and Total** pane:

- ☐ On the **Format** tab, in the **Grouping & Totals** group, click **Group & Sort** .

Sort on a single field

- 1) Right-click any value in the field that you want to sort.
- 2) On the shortcut menu, click the sort option you want.
 - a) For example, to sort a text field in ascending order, click **Sort A to Z** . To sort a numeric field in descending order, click **Sort Largest to Smallest** .
- 3) Access sorts the report as you specified.
 - a) If the **Group, Sort, and Total** pane is open, you can see that a new **Sort by** line for the field has been added.

Note: When you apply sorting by right-clicking a field in Layout view, you can only sort one field at a time. Applying sorting to another field removes the sorting on the first field. This differs from the sorting behavior in forms, where multiple sort orders can be established by right-clicking each field in turn and the choosing the sort order you want.

Group on a field

- 1) Right-click any value in the field on which you want to group.
- 2) On the shortcut menu, click **Group On** .
- 3) Access adds the grouping level and creates a group header for it.

2) Create a summary report (without record details)

If you want to show only totals (that is, just the information in header and footer rows), on the **Format** tab, (or on the **Design** tab in Design view), in the **Grouping & Totals** group, click **Hide Details**. Doing this hides the records at the next lower level of grouping, resulting in a much more compact presentation of the summary data. Although the records are hidden, the controls in the hidden section are not deleted. Click **Hide Details** again to restore the Detail rows to the report.

Internet and World Wide Web

Introduction to Internet

The Internet links are computer networks all over the world so that users can share resources and communicate with each other. Some computers, have direct access to all the facilities on the Internet such as the universities. And other computers, eg privately-owned ones, have indirect links through a commercial service provider, who offers some or all of the Internet facilities. In order to be connected to Internet, you must go through service suppliers. Many options are

offered with monthly rates. Depending on the option chosen, access time may vary. The Internet is what we call a metanetwork, that is, a network of networks that spans the globe. It's impossible to give an exact count of the number of networks or users that comprise the Internet, but it is easily in the thousands and millions respectively. The Internet employs a set of standardized protocols which allow for the sharing of resources among different kinds of computers that communicate with each other on the network. These standards, sometimes referred to as the Internet Protocol Suite, are the rules that developers adhere to when creating new functions for the Internet.

The Internet is also what we call a distributed system; there is no central archives. Technically, no one runs the Internet. Rather, the Internet is made up of thousands of smaller networks. The Internet thrives and develops as its many users find new ways to create, display and retrieve the information that constitutes the Internet.

The unique thing about the Internet is that it allows many different computers to connect and talk to each other. This is possible because of a set of standards, known as protocols, that govern the transmission of data over the network: TCP/IP (Transmission Control Protocol/Internet Protocol). Most people who use the Internet aren't so interested in details related to these protocols. They do, however, want to know what they can do on the Internet and how to do it effectively.

The Client/Server Model:

The most popular Internet tools operate as client/server systems. You're running a program called a Web client. This piece of software displays documents for you and carries out your requests. If it becomes necessary to connect to another type of service--say, to set up a Telnet session, or to download a file--your Web client will take care of this, too. Your Web client connects (or "talks") to a Web server to ask for information on your behalf.

The Web server is a computer running another type of Web software which provides data, or "serves up" an information resource to your Web client.

All of the basic Internet tools--including Telnet, FTP, Gopher, and the World Wide Web--are based upon the cooperation of a client and one or more servers. In each case, you interact with the client program and it manages the details of how data is presented to you or the way in which you can look for resources. In turn, the client interacts with one or more servers where the information resides. The server receives a request, processes it, and sends a result, without having to know the details of your computer system, because the client software on your computer system is handling those details. The advantage of the client/server model lies in distributing the work so that each tool can focus or specialize on particular tasks: the server serves information to many users while the client software for each user handles the individual user's interface and other details of the requests and results.

Internet Access

Internet access is often provided at home, schools, workplaces, public places, internet cafes, libraries and other locations. The internet began to gain popularity with dial-up internet access. In a relatively short time, internet access technologies changed, providing faster and more reliable options. Currently, broadband technologies such as cable internet and ADSL are the most widely used methods for internet access. The speed, cost, reliability and availability of internet access depends on the region, internet service provider and type of connection.

There are many different ways to obtain internet access, including:

- Wireless connection
- Mobile connection
- Hotspots
- Dial-up
- Broadband
- DSL
- Satellite

Access to computers or smart devices is one of the important factors for understanding the level of internet access for a region. However, internet access is not uniformly distributed within or between countries. A digital divide exists between many countries and regions. Good internet access is associated with regions with high-income populations, a high development index and high technological development.

Internet Addressing

Each host on a TCP/IP network is assigned a unique 32-bit IP address consisting of a *network number* and a *host number*. The network number identifies a specific network, and must be assigned by the *Internet Network Information Center* (InterNIC) or an accredited registrar. An Internet Service Provider (ISP) can obtain blocks of network addresses from InterNIC and can assign addresses as necessary. The host number identifies a host on a network and is assigned by the network administrator. The IP address is grouped into four binary *octets* (an octet is a group of eight bits) and is represented using *dotted decimal notation*. The minimum value for an octet is 0, and the maximum value is 255. The basic format is illustrated below.

The basic format of an IP address

IP addressing supports five address classes - A, B, C, D, and E, of which only classes A, B, and C are available for commercial use. The following table illustrates the IP address classes.

IP Address Classes				
Class	Format	Purpose	Address range	Max hosts
A	N.H.H.H	A few large organisations	1.0.0.0 - 126.0.0.0	16,777,214
B	N.N.H.H	Medium-size organisations	128.1.0.0 - 191.254.0.0	65,534
C	N.N.N.H	Relatively small organisations	192.0.1.0 - 223.255.254.0	254
D	N/A	Multicast groups (RFC 1112)	224.0.0.0 - 239.255.255.255	N/A
E	N/A	Experimental	240.0.0.0 - 254.255.255.255	N/A
(N = Network number, H = Host number)				

The diagram below illustrates the format of the commercial IP address classes.

The format of the commercial IP address classes

The address class can be determined using the following table. For example, IP address 172.31.1.2 has a first octet of 172, which falls between 128 and 191, so 172.31.1.2 is a Class B address.

Determining the Address Class		
Class	First octet	High-order bits
A	1 - 126	0
B	128 - 191	10
C	192 - 223	110
D	224 - 239	1110
E	240 - 254	1111

Note that addresses beginning with 127 are used by some systems for special purposes. Note also that addresses with all zeros in the host part of the address refer to the network itself, and addresses ending in 255 are not used to refer to individual hosts on the network, since they are considered to be broadcast addresses.

IPv6 addresses are typically composed of a 64-bit network prefix, and a 64-bit host part. The host part may be automatically generated from the interface's MAC address, or assigned sequentially. IPv6 addresses are normally written as eight groups of four hexadecimal numbers. A group consisting solely of zeros can be omitted. For example, 2001:0db8:85a3:0000:1319:8a2e:0370:1337 can be shortened to 2001:0db8:85a3::1319:8a2e:0370:1337. Note, however, that there must be only one double colon in an address. Leading zeros in a group can also be omitted, so the addresses below are all valid and equivalent to each other:

2001:0db8:0000:0000:0000:0000:1428:57ab
2001:0db8:0000:0000:0000::1428:57ab
2001:0db8:0:0:0:0:1428:57ab
2001:0db8:0:0::1428:57ab
2001:0db8::1428:57ab
2001:db8::1428:57ab

Introduction and use of Email:

Email, short for Electronic Mail, consists of messages which are sent and received using the Internet. There are many different email services available that allow you to create an email account and send and receive email and attachments, many of which are free. Today we will focus on the services available through

Yahoo! Mail because it is free and one of the more popular email services available, but we will also give hints, examples and advice for Gmail and the email software programs Outlook, Outlook Express, and Thunderbird.

What is email?

Electronic mail (also known as **email** or **e-mail**) is one of the most commonly used services on the Internet, allowing people to send messages to one or more recipients. Email was invented by Ray Tomlinson in 1972.

Why use email?

The operating principle behind email is relatively simple, which has quickly made it the most popular service used on the Internet.

As with a traditional postal service, for your message to reach your recipient, all you need to know is their address. Its two main advantages over "paper mail" are the speed at which the email is sent (practically instantaneous) and the lower cost (included with the cost of an Internet connection).

What's more, email can be used to instantaneously send a message to several people at once.

Use of Email:

Advantages of email

1. Fast and cheap
2. Ideal way to reach persons who are difficult to get on the phone (e.g. most physicians!)
3. Because it is written, you can compose and review your message before sending
4. Ideal for international communications (expense, problems reaching colleagues, differences in time zones)
5. Convenient and non-intrusive: I typically review and answer emails late at night after the kids have gone to bed
6. You can check your email from any computer in the world; e.g., while visiting, from a hotel room, in your car, etc.
7. You can easily include all or part of previous messages, or the message you are responding to, including point by point responses to questions, etc.
8. Ability to send same message to predefined groups of people
9. Ability to include attached files, documents, pictures, datasets
10. Messages easily archivable and storable in a database; search by sender, date, subject, or put into separate mailboxes
11. Ability to paste from other applications directly into email document (e.g., a review of a paper found on a website)

Working of Email:

E-mail system comprises of the following three components:

- Mailer

- Mail Server
- Mailbox

Mailer

It is also called **mail program**, **mail application** or **mail client**. It allows us to manage, read and compose e-mail.

Mail Server

The function of mail server is to receive, store and deliver the email. It is must for mail servers to be sunning all the time because if it crashes or is down, email can be lost.

Mailboxes

Mailbox is generally a folder that contains emails and information about them.

Email working follows the client server approach. In this client is the mailer i.e. the mail application or mail program and server is a device that manages emails.

Following example will take you through the basic steps involved in sending and receiving emails and will give you a better understanding of working of email system:

- Suppose person A wants to send an email message to person B.
- Person A composes the messages using a mailer program i.e. mail client and then select Send option.
- The message is routed to **Simple Mail Transfer Protocol** to person B's mail server.
- The mail server stores the email message on disk in an area designated for person B.

The disk space area on mail server is called mail spool.

- Now, suppose person B is running a POP client and knows how to communicate with B's mail server.
- It will periodically poll the POP server to check if any new email has arrived for B.As in this case, person B has sent an email for person B, so email is forwarded over the network to B's PC. This is message is now stored on person B's PC.

The following diagram gives pictorial representation of the steps discussed above:

Email names and Address:

Email Names:

A blogger can always get a professional email address with something like *admin@domain.com*, but for a normal user who is using a service like Gmail, Outlook, or Yahoo mail, selecting a decent email name is crucial.

If you are a college student or someone who is starting their professional career, now is the right time to let go of the email address which no longer serves you, and create a new one which will serve you for the next several years.

How To Choose A Name For Your Email Address:

If you are just starting to get online now and are planning on getting an email address like *name.surname@emailservice.com*, it will be tough, as most of these email addresses are already taken.

The first thing you need to do is select which email service you want to use. My recommendation would be Gmail or Outlook. Gmail is great in terms of functionality, and Outlook is relatively unused (comparatively) so you can more easily get your desired email address from here.

The next step is to choose a name which doesn't suck.

Your Name

Nothing could be better than using your name as your email address.

For example:

- Harsh.Agrawal@outlook.com

If you have a common name, chances are high that this email address is already taken. If that's the case, you can play around with the name order and abbreviations.

For example:

1. AgrawalHarsh
2. HAgrawal

Many email service providers will let you use a few special characters like underscore (_), dashes (-), and periods (.) which can help you get your desired name.

For example:

1. Harsh-Agrawal
2. Agrawal.Harsh
3. H_Agrawal

Easy To Remember

Select a username which is not only easy to remember, but easy to pronounce.

Since we are dealing with a personal email address, being able to easily speak it to people will be massively helpful. Challenging pronunciations and spellings are to be avoided.

Things Not To Do While Selecting A Personal Email Address:

- Don't use any prefix or suffix (like cool, sweet, innocent, hunk, etc.) while selecting your email address.
- Your email address is all about you, so don't link your email address with the name of your boyfriend/girlfriend/dog/children/etc.
- If you're from a culture where your surname (family name) changes after marriage, try to avoid using your surname in your email address. Instead use something else which defines you like a professional title or occupation.

Whenever you are creating a new email address, think of it as your online identity. Think about how it will sound in 10-15 years. Think about what it says about who you are as a person and a professional.

Email addresses

Email addresses (both for senders and recipients) are two strings separated by the character "@" (the "at sign"):

user@domain

The right-hand part describes the domain name involved, and the left-hand part refers to the user who belongs to that domain. One or more mail servers (MX records in the Domain Name System) correspond to each domain.

An email address can be up to 255 characters long and can include the following characters:

- Lowercase letters from a to z;
- Digits
- The characters ".", "_", and "-" (full stop, underscore, and hyphen)

In practice, an email address often looks something like this:

firstname.lastname@provider.domain

Working in Blogs:

1. Choose Your Blogging Platform

Starting a blog is the best way to share your ideas and expertise online. Or expand your online business. It's great tool to promote your personal brand or business. You can also make money from your blog.

Luckily, in 2018, creating a blog is easier than ever.

When starting your blog, there are several platforms to choose from (tumblr, blogger etc..).

However, one that really stands out from the pack is WordPress.

It's FREE, very user friendly, and perfect for people who've never built a blog before.

Why People Use & Recommend WordPress?

- It's FREE (you only need a web host & domain name)
- There are 5,000+ free & paid WordPress themes available to make your design look top-quality.
- They have super helpful support forum.
- It offers 45,000+ free plugins to help your blog run more smoothly and efficiently.

91% of *all blogs* are running on WordPress, including this one— WebsiteSetup.org and WordPress is also used by 62% of the top 100 company blogs.

Why you SHOULDN'T create a blog on a free platform

It's true, you can create your blog free. But it'll be very limited in functionality, it'll look boring, and the address will look somewhat childish (e.g., YourBlog.WordPress.com), which diminishes your credibility.

There are some *serious* flaws in free options you need to know about:

1. **No Control** – Your blog is being hosted on another website (e.g., wordpress.com, tumblr.com, blogspot.com). If you violate their terms of service (even by accident), they can shut down your blog any time (it has happened before).
2. **No Customization** – You can't use all the free plugins or themes. Heck, you can't even use custom themes to really make your blog stand out.
3. **Other Limitations** – Free space of only 3GB. For posts, images, and perhaps videos—that's just not enough.

In short, don't create a free blog, especially if you're serious about starting a blog. Later migrating to a better option from a free blogging platform can be very time consuming and tricky.

Instead, create a self-hosted WordPress blog where you don't have any limitations. Plus, you'll be able to use your own (professional) domain name.

This leads me to the next step: finding a domain name.

2. Choose a Domain Name (www.YourBlog.com)

Before you go any further, you need to choose a domain name.

Your domain name is important because:

- It's your "first impression" to website visitors.
- It affects your rankings in search engines.
- It defines your brand.

With that in mind, you should put *some* thought into your domain name, but not *too* much.

If you come up with something you like within 5 minutes, give it a go. (You can change it later). But here are a few domain tips to get you started:

- **Choose brandable over generic.** A brandable domain name is unique and stands out from the competition, while a generic domain name is usually stuffed with keywords and unmemorable. (For example, *www.LisasRocks.com* is more brandable than *www.RockCollectingBlog.com*.)
- **Keep it concise.** According to research from Gaebler.com, a magazine for entrepreneurs, the top-100 websites have approximately 6 characters in their domain name.
- **Easy to type and pronounce.** Your domain name should roll off the tips of your fingers and the tips of your tongue without any problem.

3. Sign Up With Web Host and Install WordPress

What is Web Hosting and Why Do You Need it?

Web Hosting is the service that keeps your blog accessible for everyone. It stores all the files, images and content that your blog has and displays it to the visitors.

If you don't have a web host, you won't be able to set up a blog for others to see nor will you be able to use your own domain name.

There Are Good & Bad Hosting Companies

Choosing your host is one of the **most important aspect of creating your blog**.

Bad web hosts cause most of the issues people have related to their blog. For example, unhelpful customer service and hidden fees are quite common...

Many cheap hosts also overuse servers to cut their costs—and that leads to your site potentially not working just because many people are visiting some other site. Only some cheaper hosts control the resources well, so that your website always works right.

Disclosure: Because I've used Bluehost and found their hosting great, all links to Bluehost are referral links. I'll earn a commission if you make a purchase and you'll get a discounted price. This is how I keep WebsiteSetup.org up and running.

1. They have one-click WordPress installation, which makes it easy for you to get started.
2. They've been officially recommended by WordPress since 2005.
3. They're only \$2.95/mo for WebsiteSetup.org visitors + **they throw in a FREE domain name**.

Of course, you don't need to use Bluehost if you don't want to. Feel free to use any other web hosting provider that is suitable with WordPress, reliable, secure and easy to manage (i.e. one-click-install for WordPress).

Here's a simple step-by-step guide for creating a blog on Bluehost (or any other web host)

1. Sign up with a web hosting (I recommend Bluehost).
2. Choose the hosting plan (you can pick the cheapest one).
3. Pick a domain name for your blog.
4. Complete hosting registration.
5. Install WordPress.
6. Log in and write a blog post.

Altogether, this takes about 5-10 minutes if you follow the instructions (and you have chosen your domain name). So, you can start writing your first post in just a few minutes.

Possible Questions – UNIT V

PART –A (1MARK)

(Online Examinations)

PART- B (2 MARK)

1. What is Ms Access?
2. What is Primary Key?
3. Discuss about Splitting forms.
4. What is query?
5. Mention uses of query.
6. What is Internet?
7. What are the different ways to obtain Internet Access?
8. What is Email?
9. Write the advantages of Email.
10. What are the different types of Report?

PART-C (6 MARK)

1. Explain about planning a database.
2. How to create new database?
3. How to enter and edit data in tables with examples.
4. Explain about the creation of queries.
5. Discuss about report creation.
6. Elaborate about Grouping and Sorting with example.
7. Narrate about Internet Addressing.
8. Explain in detail about working of Email.
9. Discuss Email names and Addresses.
10. Illustrate about working in blogs.

KARPAGAM ACADEMY OF HIGHER EDUCATION

DEPARTMENT OF COMMERCE (CA)

SUBJECT: INTRODUCTION TO INFORMATION TECHNOLOGY
SEMESTER : I
SUBJECT CODE: 18CCU102
CLASS : I B.COM CA
UNIT- V-MS-Access

S.NO	QUESTIONS	OPTION 1	OPTION 2	OPTION 3	OPTION 4	ANSWERS
1	What are the different views to display a table?	Datasheet View	Design View	Pivot Table & Pivot Chart View	All Of Above	Datasheet View
2	Which of the following creates a drop down list of values to choose from?	Ole Object	Hyperlink	Memo	Lookup Wizard	Lookup Wizard
3	The command centre of access file that appears when you create or open the Ms Access database file _____	Database Window	Query Window	Design View Window	Switchboard	Database Window
4	In a database table, the category of information is called _____	Tuple	Field	Record	All Of Above	Field
5	This key uniquely identifies each record _____	Primary Key	Key Record	Unique Key	Field Name	Primary Key
6	It is an association established between common	Line	Relationship	Primary Key	Records	Records
7	Which of the field has width 8 bytes?	Memo	Number	Date/time	Hyperlink	Date/time
8	This is the stage in database design where one gathers and list all the necessary fields for the database project _____	Data Definition	Data Refinement	Establishing Relationship	None Of The Above	Data Definition
9	The following is not a database model	Network Database Model	Relational Database Model	Object Oriented Database Model	None	None
10	Microsoft Access is a _____	RDBMS	OODBMS	ORDBMS	Network Database Model	RDBMS
11	The Database Language that allows you to access or maintain data in a database _____	DCL	DML	DDL	None Of Above	DCL
12	What is the maximum length a text field can be?	120	255	265	75	255
13	Which of the following is not a Database Object?	Tables	Queries	Relationships	Reports	Relationships
14	A _____ enables you to view data from a Table Based on a Specific Criterion	Form	Query	Macro	Report	Query
15	What a are the columns in a Microsoft Access table called?	Rows	Records	Fields	Columns	Fields
16	Which of the following is not a type of Microsoft Access Database Object?	Table	Form	Worksheets	Modules	Worksheets
17	What method can you use to add a new table to your database?	Use Design View to create a table	Enter data directly by using a datasheet	Both of above	All of the above	Both of above
18	Which action do you use in a a macro to automatically send a report snapshot in an email message?	Use mail	Send object	Run macro	All of the above	Send object
19	The checking operation performed on input data is called the	Validation of data	Verification of data	Cross check	Control of data	Validation of data
20	A form defines	data is placed on the screen	The width of each field	Both a and b	All of the above	Both a and b
21	Which type of query extract the data and put them into separate table?	A parameter query	A make-table query	An update query	A crosstab query	A make-table query
22	Which of the following criterion is NOT written using the proper syntax	values	<500	NO VALUE	Between #1/1/2000# and #12/31/2000#	NO VALUE
23	Which property determines what is displayed in a control?	The control source property	The display property	The comes from property	The data property	The control source property
24	How can you view the properties of a form	Select View>Form properties form the menu	Right click anywhere on the form and select properties form the shortcut menu	Double click the form selector box in the upper left corner of the form	All of the above	Right click anywhere on the form
25	Which of the following type of queries are action queries?	Update queries	Crosstab Queries	Parameter queries	Append Querits	Append Querits
26	Which of the following is NOT a report section?	Report Header section	Summary section	Page header section	Details section	Summary section
27	How can you display the relationship in a database?	Select View > Relationship form the menu	Click the Relationship button on the toolbar	Select Edit >Relationship from the menu	Click the Relationship button in the Database window	Click the Relationship button
28	If you are creating a cross tab query, what must table you are querying contain?	Lots of confusing information	More than 100 records	At least one field	All of the above	At least one field
29	A query summarizes information in a grid, organized by regions and months. Which type of query is this?	An update query	A parameter query	An action query	A cross tab query	A cross tab query
30	What type of text box does the toolbox and to a form?	Bound	Rebound	Calculated	Unbound	Unbound
31	Queries in Access can be used as	view, change and analyse data in different ways	a source of records for forms and reports	Only a		view, change and analyse data in different ways
32	If you write criteria values vertically one in a row it will mean	OR conditions	AND conditions	NOT condition	None of above	NOT condition

33	To achieve AND effect when you are entering criteria in a query design window	write criteria values vertically one in a row	write criteria values horizontally	Write criteria values in same field separated with AND	Write criteria values in same field separated with &	write criteria values horizontally
34	A search value can be an exact value is_____	Logical Operator	Relationship	Wild card character	Comparison operation	Wild card character
35	It is a database object to view, change, and analyse data in different ways	query	form	report	None of the above	query
36	Unlike text data type, this can store up to maximum of 65, 535 characters.	memo	data/time	number	All of above	memo
37	The key uniquely identifies each record in a table.	primary key	key word	filed name	All of above	primary key
38	Which of the following database object is created first before any other created?	Table	Form	Report	Query	Table
39	This form displays multiple records, one per row, in the Form window	Datasheet	Tabular	Columnar	Justified	Datasheet
40	In Access, this operation copies a backup file from the storage medium back onto the computer	Recreate	Restore	Copy	Structure	Restore
41	When creating an input mask this character does not require an entry, but if an entry is made it must be a letter from A-Z	?	!	#	\	?
42	Microsoft _____ 2016 is Microsoft's most current database management system.	PowerPoint	Access	Records	Word	Excel
43	Facts about people, events, ideas, or things are _____.	information	data	knowledge	objects	data
44	Facts that have been manipulated and have meaning become _____.	information	data	knowledge	objects	information
45	Which of the following is NOT true about databases?	In business, data is collected and used for decision making.	Information is data that has been manipulated.	A database eliminates the need for a paper-based system.	Databases are used for operational processing and for analytical purposes.	A database eliminates the need for a paper-based system.
46	_____ are raw facts.	Data	Information	Queries	Objects	Data
47	The power of an _____ is the ability to link tables to one another.	suite	ACCDB	DBMS	database	DBMS
48	In a database, data is stored in a _____.	report	form	table	query	table
49	You can use a database _____ to ask a question of the data.	report	form	table	query	query
50	The _____ view of a table displays the data stored in the table.	Layout	Datasheet	Design	Report	Datasheet
51	Each column in an Access table is called an _____.	record	field	piece	section	field
52	An _____ is a specific piece of information that is stored in every record.	record	link	attribute	relationship	attribute
53	A phone number is an example of an _____.	attribute	entity	relationship	property	attribute
	An _____ is a link between tables.	field	property	relationship	line	relationship
54						
55	Access can import smaller sections of a worksheet known as a _____.	named range	slicer	definition	delimiter	named range
56	Data can be entered into a database using one of two methods: entering the data directly into the table or entering it in __	a query	a report	a form	the relationship window	a form
57	The _____ allows you to move to the top and bottom of a table or scroll to a specific record.	Forward and Backward arrows	Navigation bar	Arrows bar	Navigation Pane	Navigation bar
58	A _____ is used as a placeholder for an unknown part of a value or to match a certain pattern in a value.	wildcard character	Replace command	Find command	Find & Replace command	wildcard character
	If you can see the blinking insertion point in a field, you are in _____.	Design view	Navigation mode	Layout view	Edit mode	Edit mode
59						
60	When you create a form from two tables that have a one-to-many relationship,first table selected becomes the main form and the second table you select becomes the__	joined form	co-form	split form	subform	subform

INTRODUCTION TO INFORMATION TECHNOLOGY

Time : 2 Hours
Date and Session :

Max. Mark : 50

PART – A (20X 1 = 20 MARKS)

1. The main store of the CPU is also called
 - a) main memory
 - b) temporary memory
 - c) immediate access store
 - d) main memory and immediate access store
2. ALU stands for -----
 - a) Arithmetic Logic Unit
 - b) Array Logic Unit
 - c) Application Logic Unit
 - d) Algorithm Logic Unit
3. A light sensitive device that converts drawing, printed text or other images into digital form is
 - a) Keyboard
 - b) Plotter
 - c) OMR
 - d) Scanner
4. The ability of MS Word to combine name and addresses with a standard document is called
 - a) document formatting
 - b) database management
 - c) mail merge
 - d) form letters
5. Personal computers use a number of chips mounted on a main circuit board. What is the common name for such boards?
 - a) Father board
 - b) Daughter board
 - c) Breadboard
 - d) Mother board
6. What type of device is computer keyboard?
 - a) Memory
 - b) Output
 - c) Storage
 - d) Input
7. Which of the following memory is volatile?
 - a) RAM
 - b) ROM
 - c) EPROM
 - d) PROM

8. Which of the following is the fastest?
a)CPU b) Magnetic Tapes
c)Disks d)Video Terminal
9. Computer Virus is a _____
a) Hardware b)bacteria
c)Freeware d)Software
10. The term memory applies to which one of the following
a)Logic Storage b)Input Device
c)Output Device d)Storage
- 11.The device primarily used to provide hardcopy is the
a)CRT b)Computer c)line printer d)Printer Card
12. A list of instructions used by a computer is called
a) Text b)CPU c)Program d) Output Program.
- 13.Which one is not an input device?
a)Keyboard b)Mouse c)Speaker d)printer
14. Memories which can be read only are called _____.
a)RAM b)ROM c)DRAM d)Secondary Memory
- 15 CPU controls _____.
a)All Input, Output and processing b)Controls Memory
c)Controlled by the input data d)ALU All Input
- 16.USB stands for _____?
a)Universal Serial Bus b) Universal Sequential Bus
c)Unique Serial Bus d)Unique Sequential Bus
- 17.CPU stands for _____ ?
a) Central Performance Unit b) Control Processing Unit
c)Common Processing Unit d)Central Processing Unit
- 18.Which of the following is not a storage device?
a)DVD b) Hard Disk c)Floppy d)Mouse
- 19.A disk's content that is recorded at the time of manufacture and cannot be changed or erased by user is
a)Read-only b) Memory-only c)Run-only d)Write-only
- 20 .What is usually used for displaying information at public places?
a)Monitors b)Overhead Monitor
c)overhead projection d)Touch screen kiosks

PART - B (3 X 2 = 6 MARKS)
(ANSWER ALL THE QUESTIONS)

- 21. List down the Characteristics of computer.
- 22. Compare and contrast between hardware and software
- 23. Write the functions of margin setting in MS-excel?

PART - C (3 X 8 = 24 MARKS)
(ANSWER ALL THE QUESTIONS)

- 24a. Elucidate the various components of hardware
(OR)
 - b. What is input device? Explain the various types of input device
- 25a. Expound the various Types of operating system.
(OR)
 - b. Explain the working principle of tables in MS-word
- 26a. Describe the followings
 - i) Converting files to different formats.
 - ii) Entering and deleting data**(OR)**
 - b. How to insert the cells in rows, columns and sheets? Explain in detailed.
* * * * *

(For the Candidates admitted from 2018)

FIRST INTERNAL EXAMINATION – JULY 2018
INTRODUCTION TO INFORMATION TECHNOLOGY
I B. Com. (CA) - I SEMESTER

Time : 2 Hours
Date and Session:

Max. Mark : 50

PART – A (20X 1 = 20 MARKS)

1. d) Main Memory and Immediate Access Store
2. a) Arithmetic Logic Unit
3. d) Scanner
4. c) Mail Merge
5. d) Mother board
6. d) Input
7. a) RAM
8. a) CPU
9. d) Software
10. b) Input Device
11. c) line printer
12. c) Program
13. d) printer
14. b) ROM
15. a) All Input, Output and processing
16. a) Universal Serial Bus
17. d) Central Processing Unit
18. d) Mouse
19. a) Read-only
20. d) Touch screen kiosks

PART - B (3 X 2 = 6 MARKS)
(COMPULSORY)

21. Characteristics of computer.

The main characteristics of computers are:

- Speed
- Storage

- Accuracy
- Versatility
- Automation
- Diligence
- Reliability

22. hardware and software:

Hardware	Software
Devices that are required to store and execute (or run) the software.	Collection of instructions that enables a user to interact with the computer.
Input, storage, processing, control, and output devices.	System software, Programming software, and Application software.
Hardware serve as the delivery system for software solutions.	Software is generally not needed to for the hardware to perform its basic level tasks such as turning on and repending to input.

22. Functions of margin setting in MS-excel:

- Change the top, bottom, left, and right margins by selecting Margins from the page setup group of age Layout Tab.
- Enter values in the header and footer fields to indicate how far from the edge of the page this text should appear.
- Check the boxes for centering horizontally or vertically on the page.
- There are three predefined margin settings.

PART - C (3 X 8 = 24 MARKS) (ANSWER ALL THE QUESTIONS)

24a. Various components of hardware

- I. Input unit: This unit accepts instructions and data.
- II. Output unit: This unit communicates the results to the user.
- III. Storage unit: This unit stores temporary and final results.
- IV. Central Processing Unit (CPU): This unit performs processing of instructions and data inside the computer.

The CPU has three components:

- a) The Control Unit - It controls the overall operation of the computer system
- b) The Arithmetic Logic Unit (ALU) - This unit performs two kinds of operations, the arithmetic processing and logical processing.
- c) The Memory Unit.

24b. Input Device:

- An input device is a hardware or peripheral device used to send data to a computer. An input device allows users to communicate and feed instructions and data to computers for processing, display, storage and/or transmission.

various types of input device

- Keyboard
- Mouse
- Joy Stick
- Light pen
- Track Ball
- Graphic Tablet
- Microphone
- Magnetic Ink Card Reader (MICR)
- Optical Character Reader (OCR)
- Bar Code Reader
- Optical Mark Reader (OMR)

26a.i) Converting files to different formats.

The current file format (.xlsx). But sometimes, you might need to save a workbook in another file format, like the file format of an earlier version of Excel, a text file, or a PDF or XPS file.

In mind that whenever you save a workbook in another file format, some of its formatting, data, and features might not be saved.

Open the workbook you want to save

Click File---> save

ii) Entering and deleting data

- Number
- Text
- Date and time
- Date in series

26b. Insert the cells in rows, columns and sheets

To insert new cells, rows, or columns in an Excel worksheet, follow these steps:

- Select the cells, rows, or columns where you want the new, blank cells to appear.
- Click the drop-down arrow attached to the Insert button in the Cells group of the Home tab.
- Click Insert Cells on the drop-down menu.

The Insert dialog box opens with the following options:

- **Shift Cells Right** shifts existing cells to the right to make room for the blank cells you want to insert.
- **Shift Cells Down** instructs Excel to shift existing cells down. This is the default option.
- **Entire Row** inserts complete rows in the cell range. You can also select the row number on the frame before you choose the Insert command.
- **Entire Column** inserts complete columns in the cell range. You can also select the column letter on the frame before you choose the Insert command.
